Fowl River Marsh Study

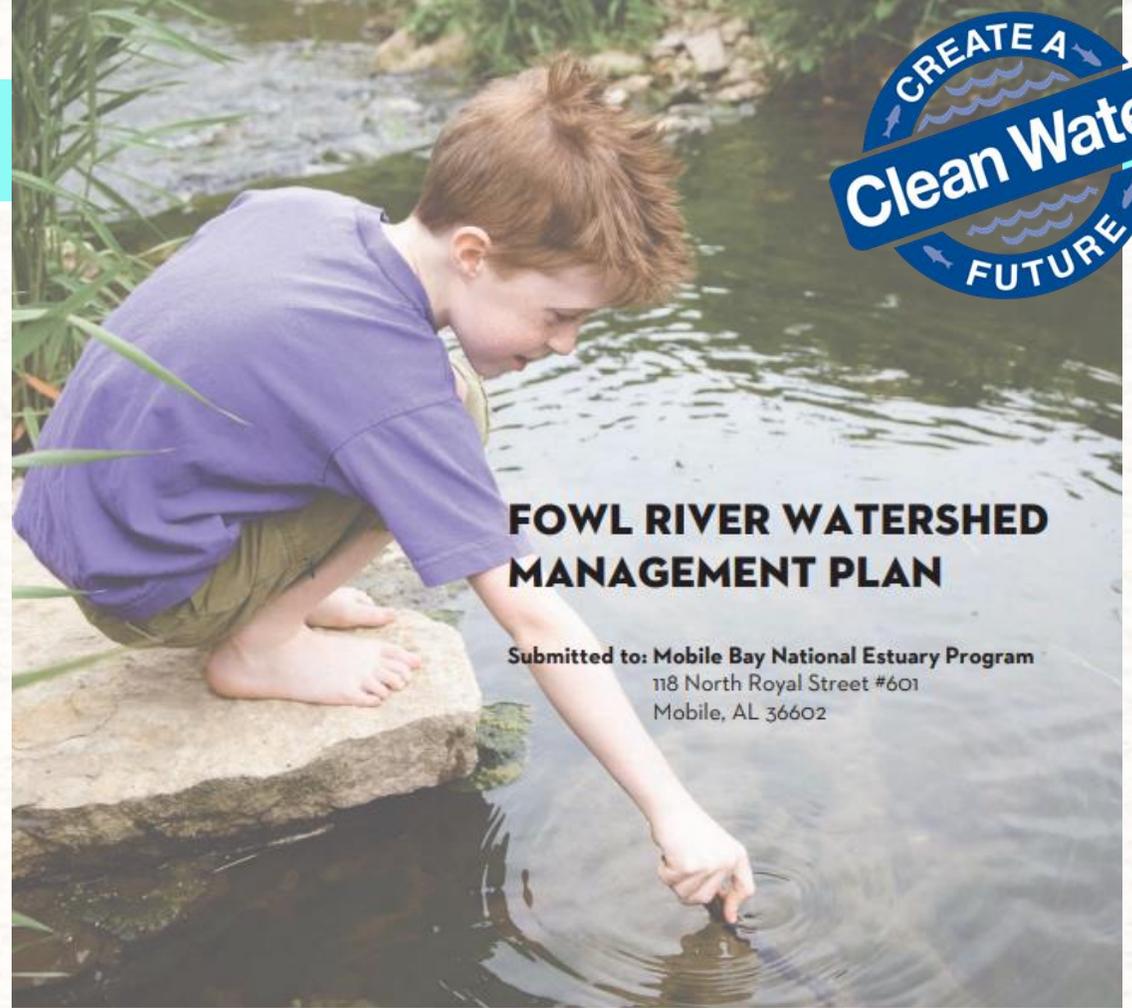

Overarching Purpose (in compliance with the MBNEP Comprehensive Conservation & Management Plan): To preserve what people value most about living on the Alabama coast (access, fisheries, heritage, environmental health and resilience, and water quality), while improving the quality of water in Mobile Bay.

Fowl River Marsh Study

A Fowl River Watershed Management Plan was completed in 2016.

One of the priorities identified in the Plan is the preservation of spits and marshes along the river.

Fowl River Marsh Study

Changes include narrowing and breaching of spits and point bars; loss of emergent habitat; and fragmentation of marshes.

Fowl River Marsh Study

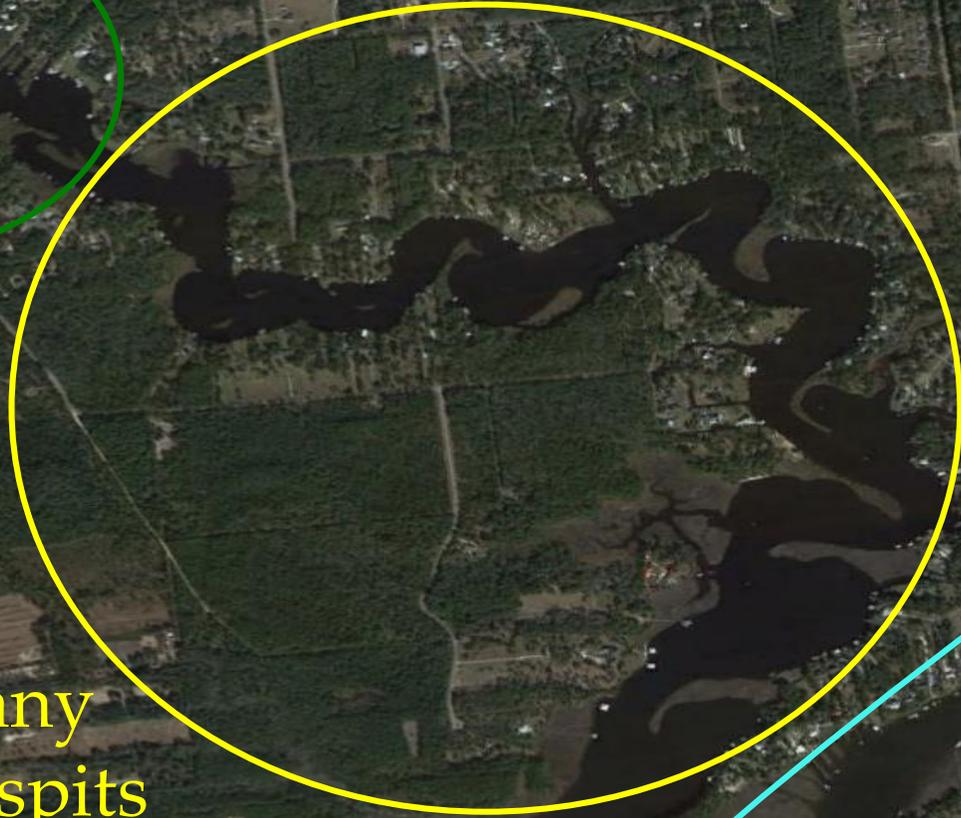

Specific goals for the study:

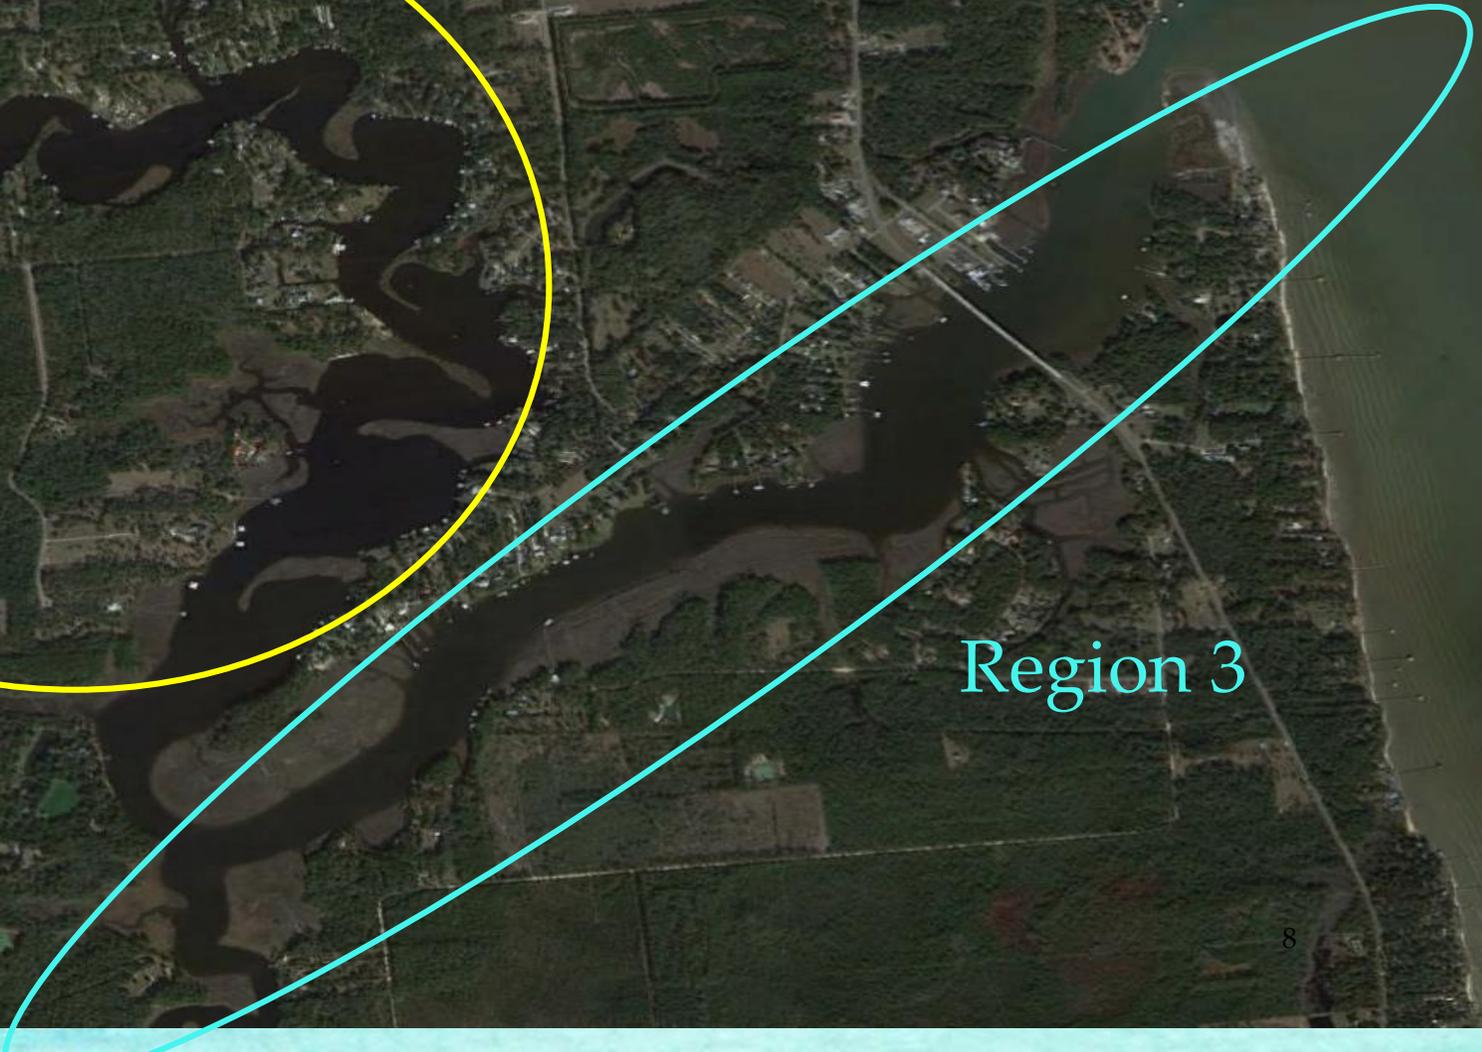

- Characterize the status and health of the wetlands in the brackish zone of Fowl River
- Understand the causes of wetland decline observed in many areas of the River
- Inform best-practice engineering designs for wetland restoration and protection

Region 1

Region 2: has many
decaying marsh spits

Region 3

Fowl River Marsh Study

- Study focused on Region 2
- Main goal: Elucidate marsh spit decay (but at the same time also documenting the status and health of marshes in the other Regions)
- Three hypothesized mechanisms (acting separately or in conjunction):
 - Sea level rise: Salt intrusion and higher flooding
 - Sediment starvation
 - Boat wakes and wave energy

Fowl River Marsh Study

- To look into these mechanisms, the study has three integrated components:
 - Vegetation: impacts of these processes on the wetlands
 - Sediments: sediment starvation
 - Hydrology: salt intrusion, flooding, nutrients, and wave energy

Vegetation, porewater salinity, and elevation characteristics of tidal marshes along Fowl River, Alabama

Just Cebrian, Joshua Goff, Tim Thibaut, Howard Horne

Fowl River Marsh Study - Vegetation

Questions

- (1) What is the general marsh health status across the 3 Study Regions?
- (2) What are the factors that influence the health of marshes in the brackish transitional zone where fresh and salt waters mix?

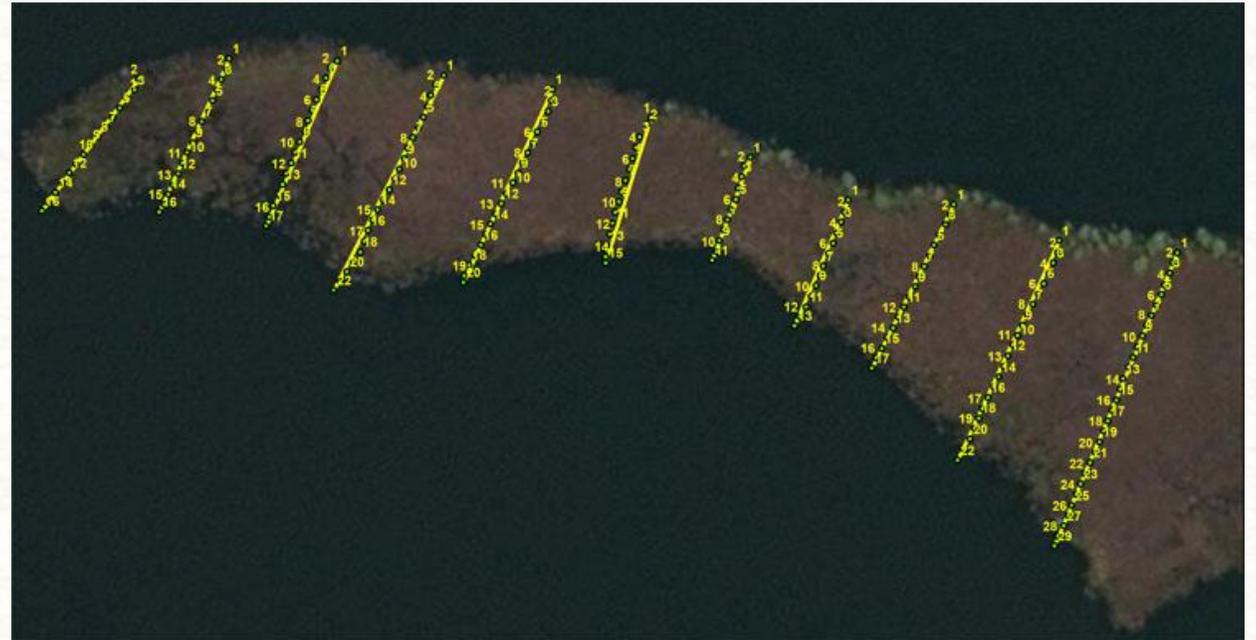

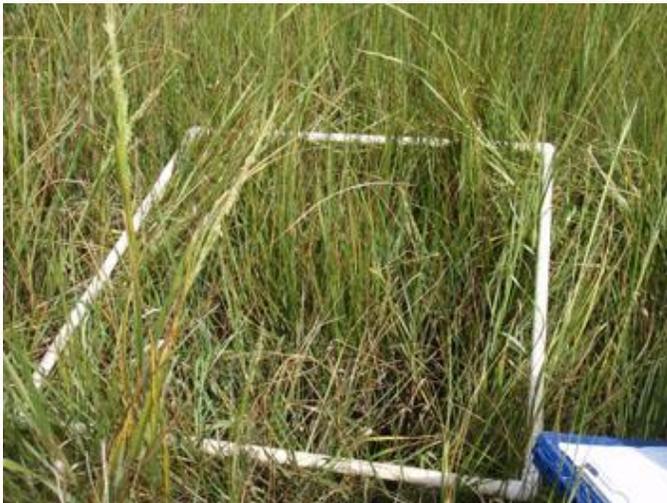

The Vegetation Component surveys were performed at 10 sites across the three Study regions, encompassing the priority spits and marshes upstream and downstream.

PLANT SPECIES DIVERSITY, DISTRIBUTION, and % COVER

Percent coverage and species composition were measured within 1-m² quadrats placed every 3 m (~ 10 ft) along survey transects.

895 quadrats were sampled along 74 survey transects in August and September, 2018. ¹⁴

MARSH ELEVATION

Trimble® Real Time Kinematic (RTK) GPS: horizontal and vertical accuracy < 5 cm (2 in)

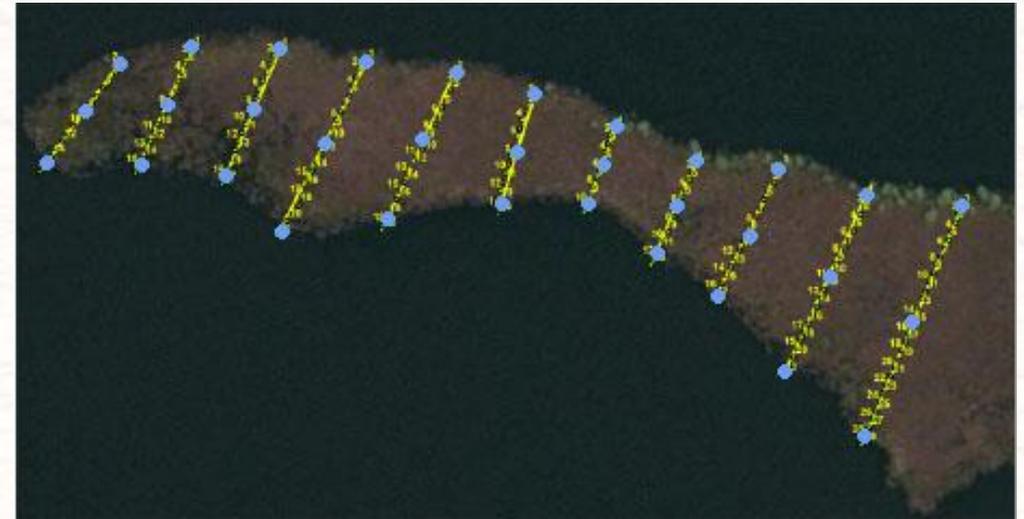

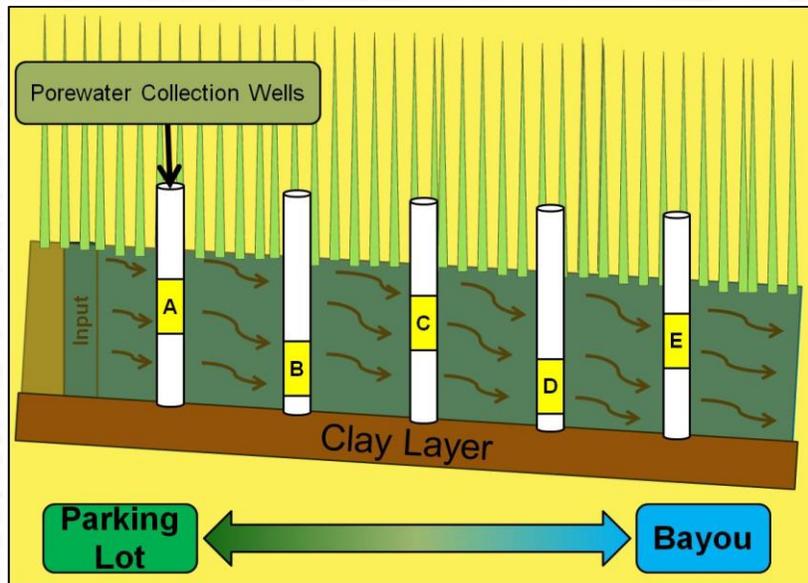

All stations

Spring and Fall
2018

MARSH POREWATER SALINITY

Marsh sediment wells: slotted PVC pipe

4 sampling rounds in 2018:

- May/June
- July
- August
- October

Plant Diversity

73 plant species were recorded in quadrats.

An additional 41 species were identified in supplemental inventory surveys.

HYDROGEOMORPHIC (HGM) MODEL

HGM assesses the capacity of Alabama fringing tidal marshes to perform specific ecosystem functions (Shafer et al. 2007)

Landscape-scale variables:
Field variables:

- Marsh Patch Size
- Mean % Cover of Marsh Vegetation
- Mean Marsh Width
- % Cover of Invasive or Exotic Species
- Aquatic Edge
- % Cover by Woody Plant Species
- Hydrologic Regime
- Vegetation Height
- Wave Energy Exposure
- Nekton Habitat Diversity
- Adjacent Land Use

HYDROGEOMORPHIC (HGM) MODEL

Variables are combined using mathematical expressions to estimate 5 major ecosystem functions.

Wave Energy Attenuation

Biogeochemical Cycling

Nekton Utilization Potential

Provide Habitat for Tidal Marsh Dependent Wildlife Species

Maintain Plant Community Composition and Structure

FLORISTIC QUALITY INDEX (FQI)

FQI estimates wetland habitat quality based on plant species composition.

A coefficient of conservatism (C value) is scaled from 0 to 10 and applied to wetland plant species, based on:

1. Breadth of habitat preference(s)
2. Tolerance to disturbance

Example C values

Black needlerush = 8

Sawgrass = 7

Torpedo grass = 0

Elevation Change

Is the elevation of the marshes stable or shifting, and what impacts can be expected from future SLR?

Is the diversity, distribution, and coverage of plant species changing?

Fowl River Marsh Study - Sediment

Decreasing Loss On Ignition (LOI) from upstream to downstream in the estuary shows that organic material is settling out in the mid and downstream areas resulting in sediment deposition dominated by organic-rich clay.

Channel bed sediment characterization

- Organic-rich clay
- Relatively coarse-grained sand

Fowl River Marsh Study - Sediment

Questions:

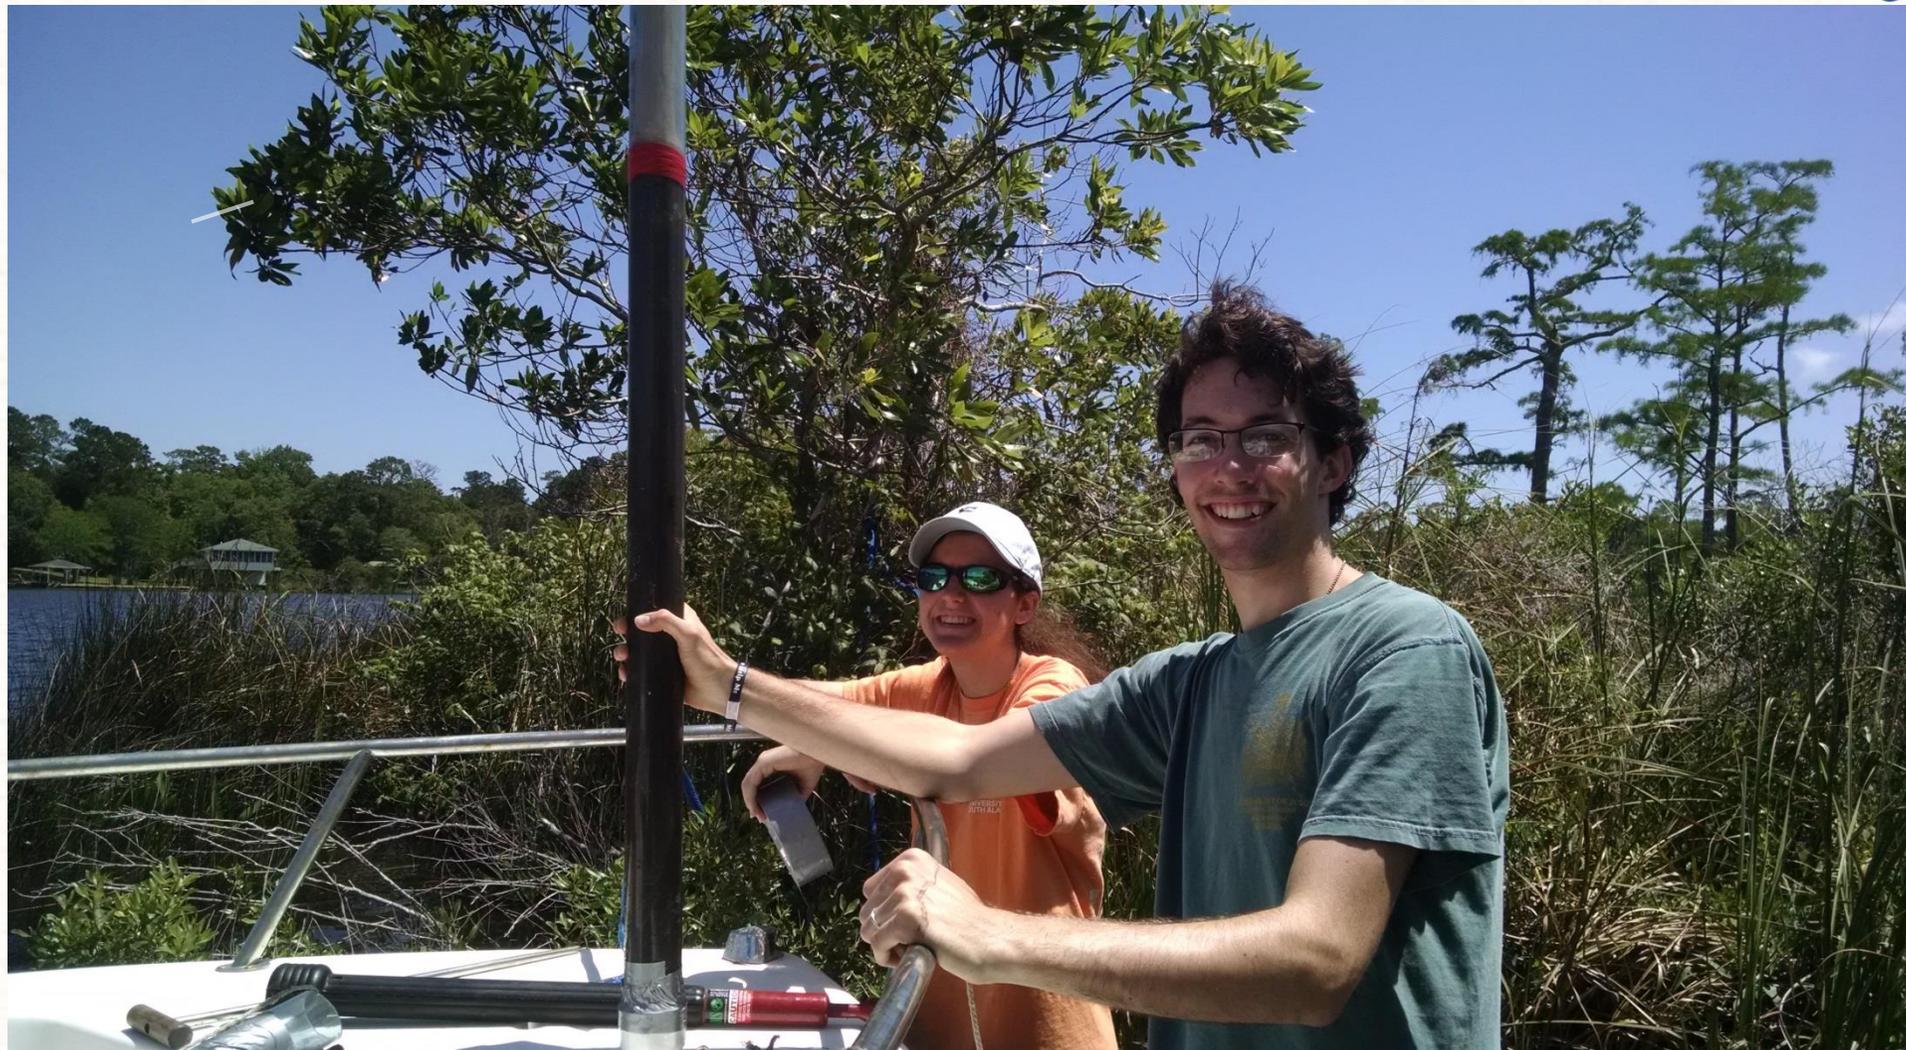

1. What is the current sediment supply, fate, and transport in Fowl river?

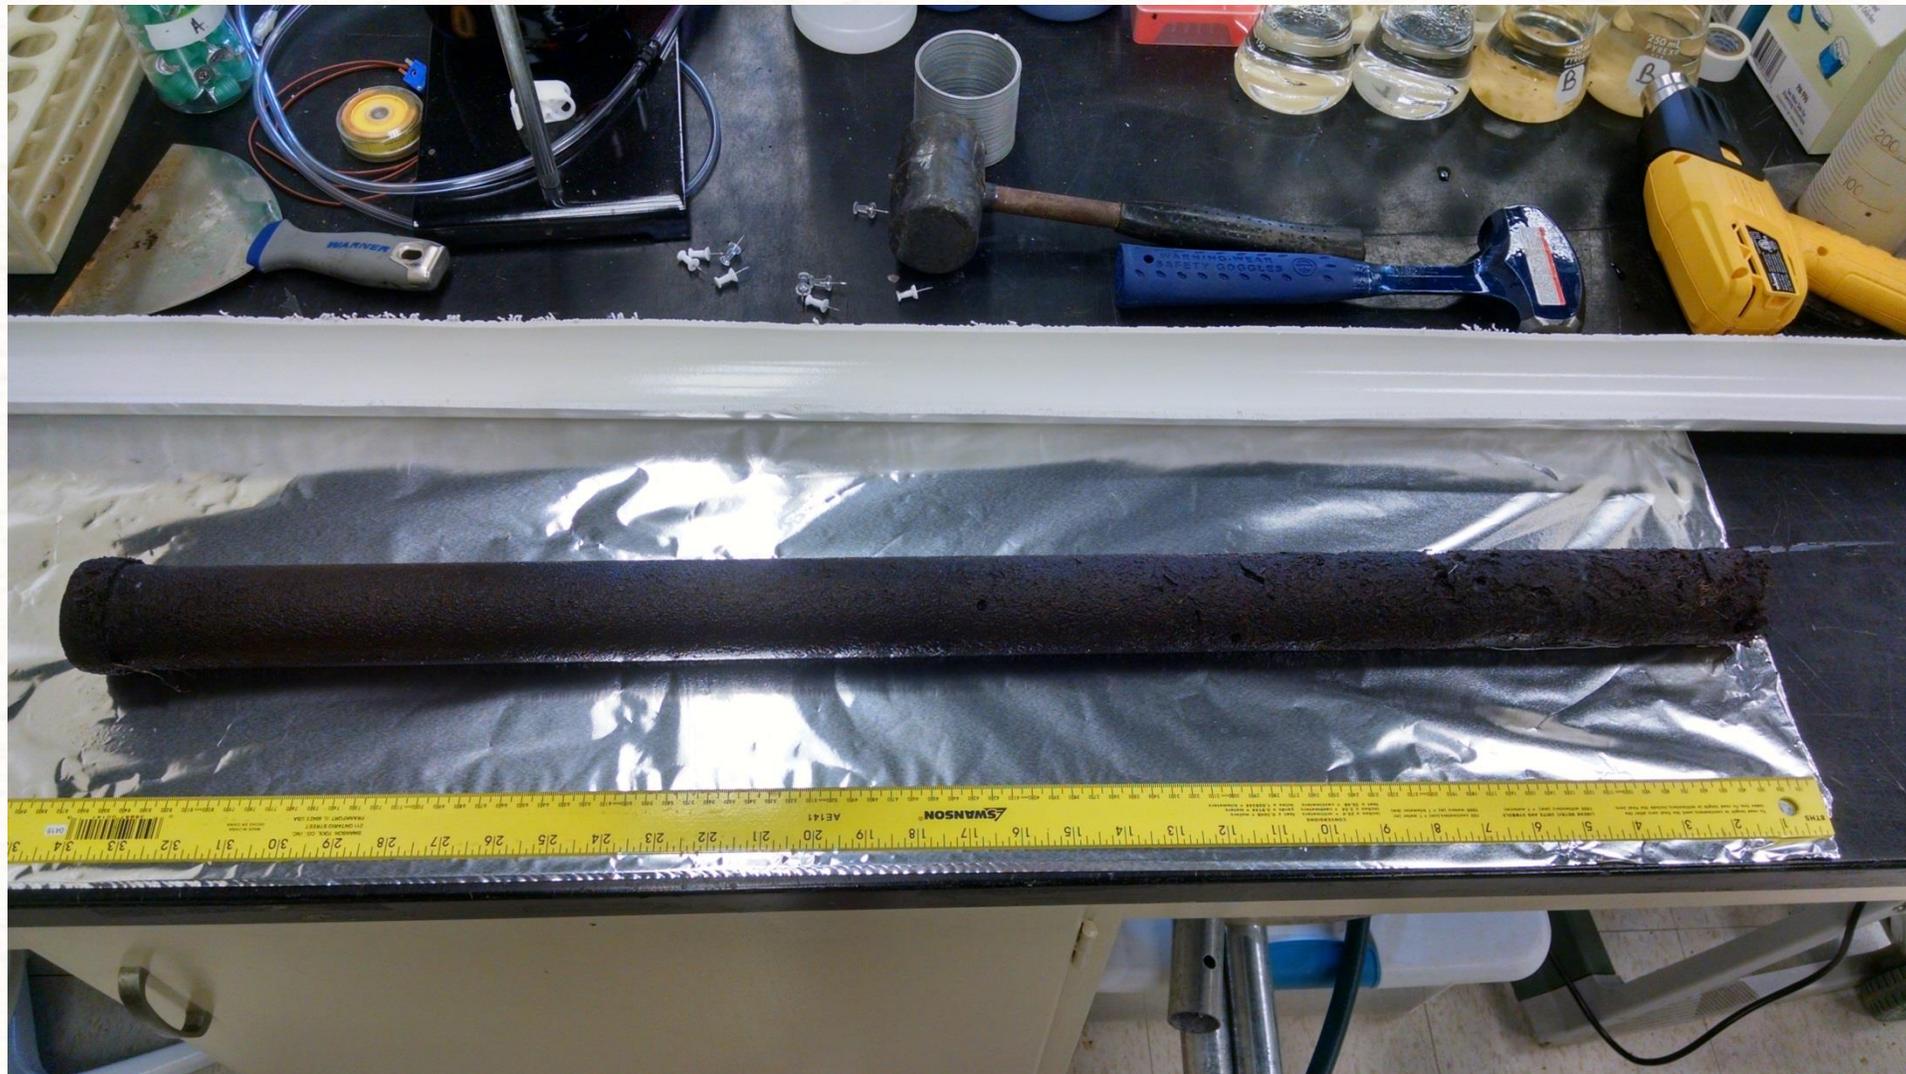

Very little river sediment reaches the spits (Region 2)

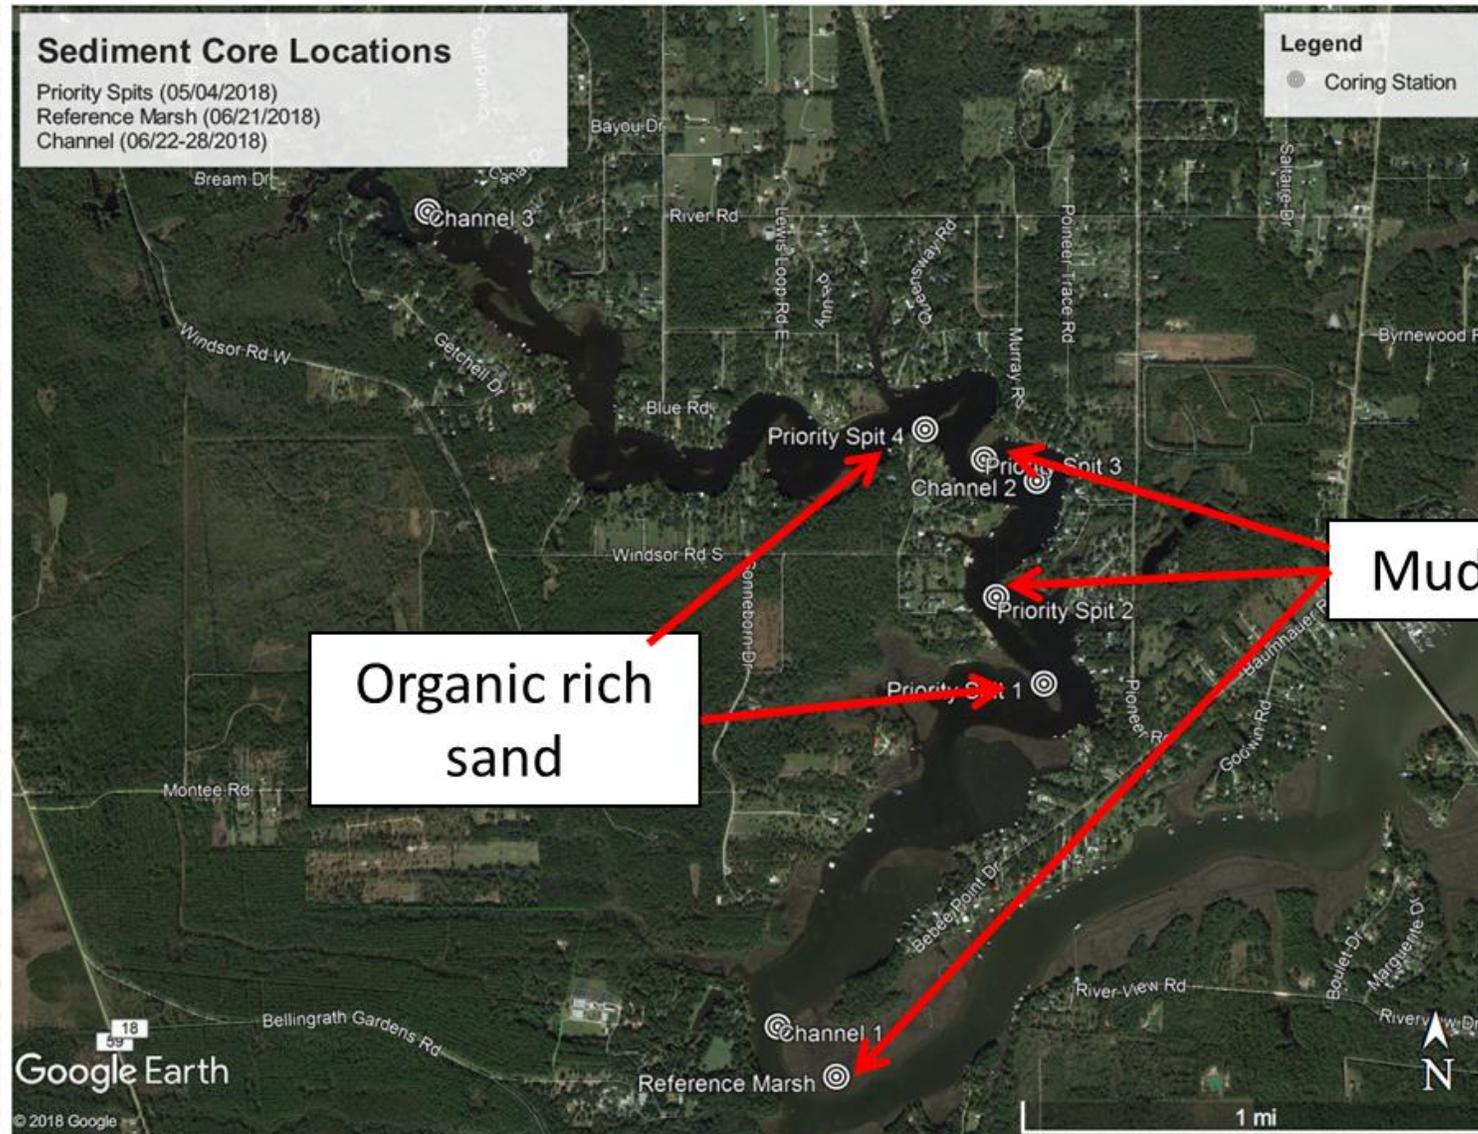

2. How do the current sediment conditions compare to the past?

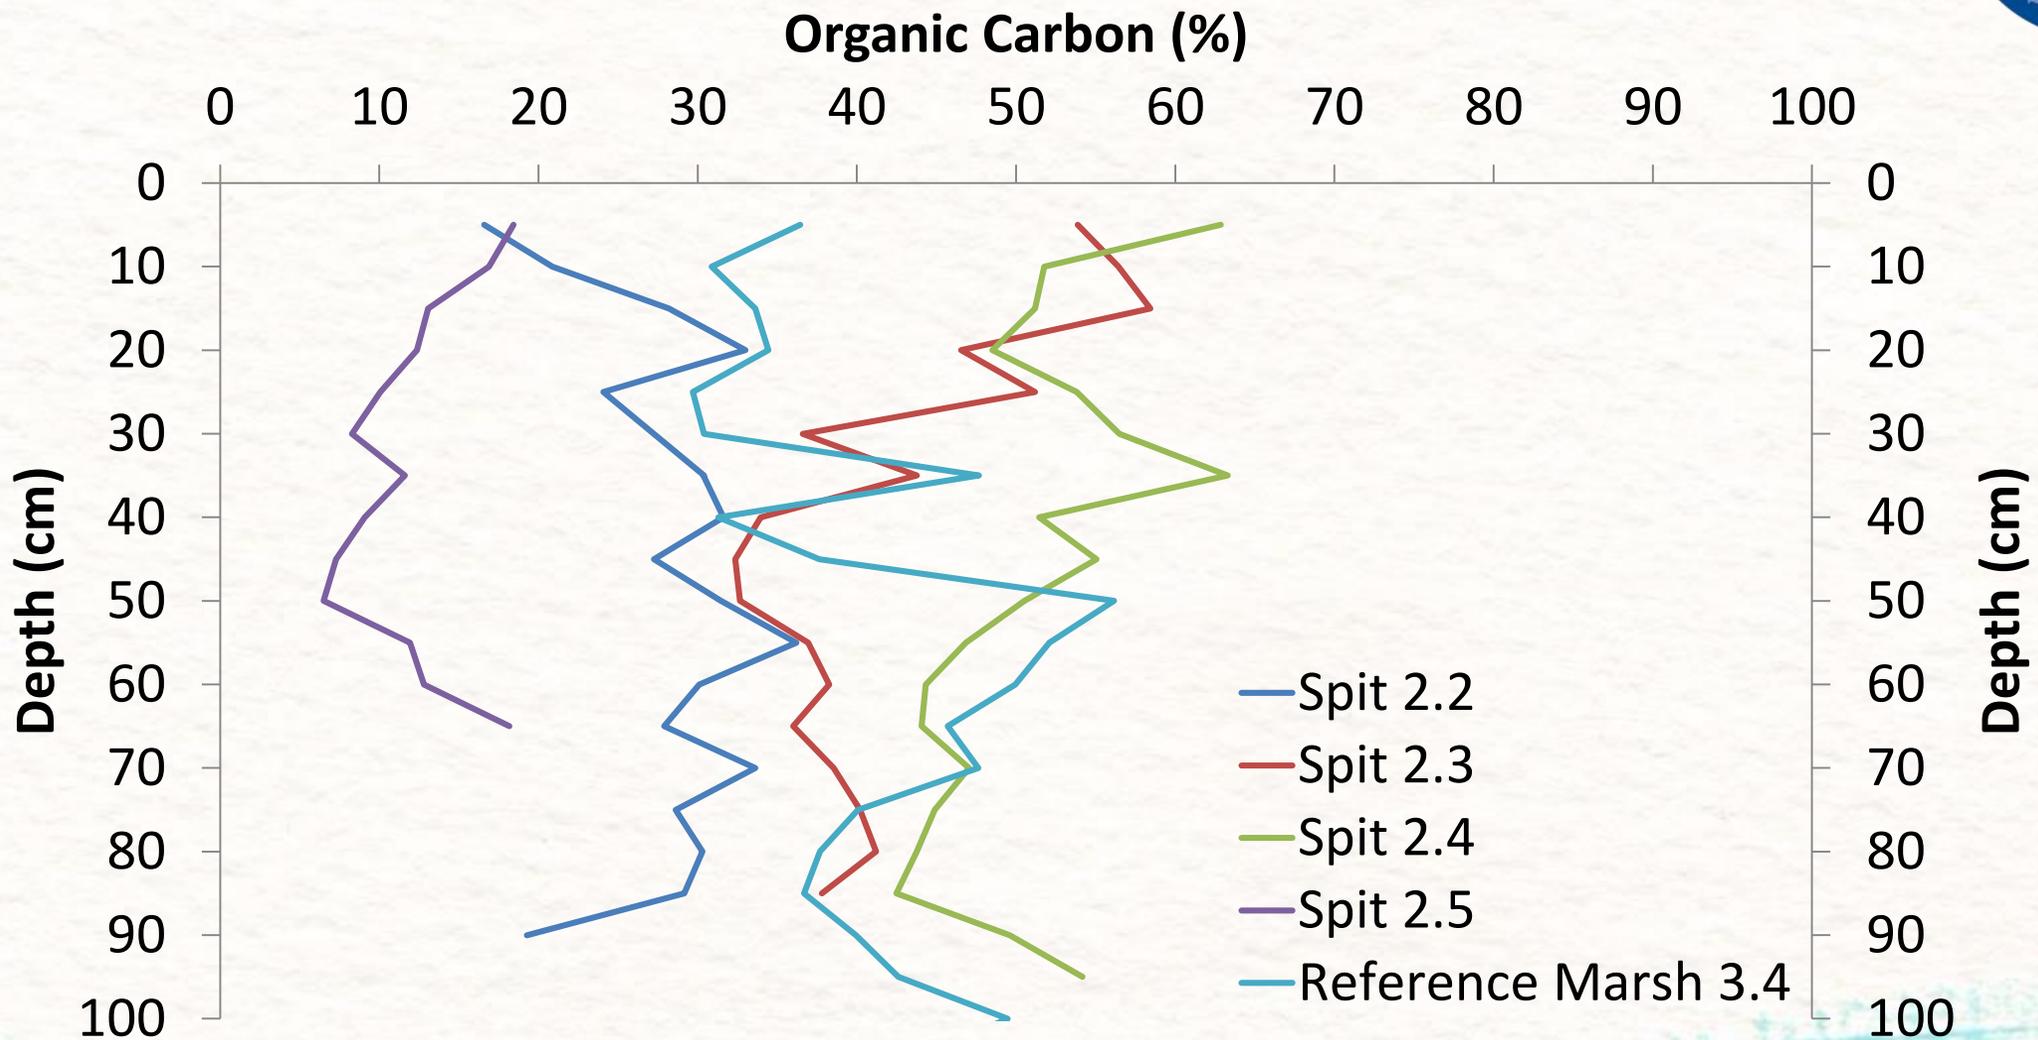

3. What are the accretion/erosion rates for the marsh?

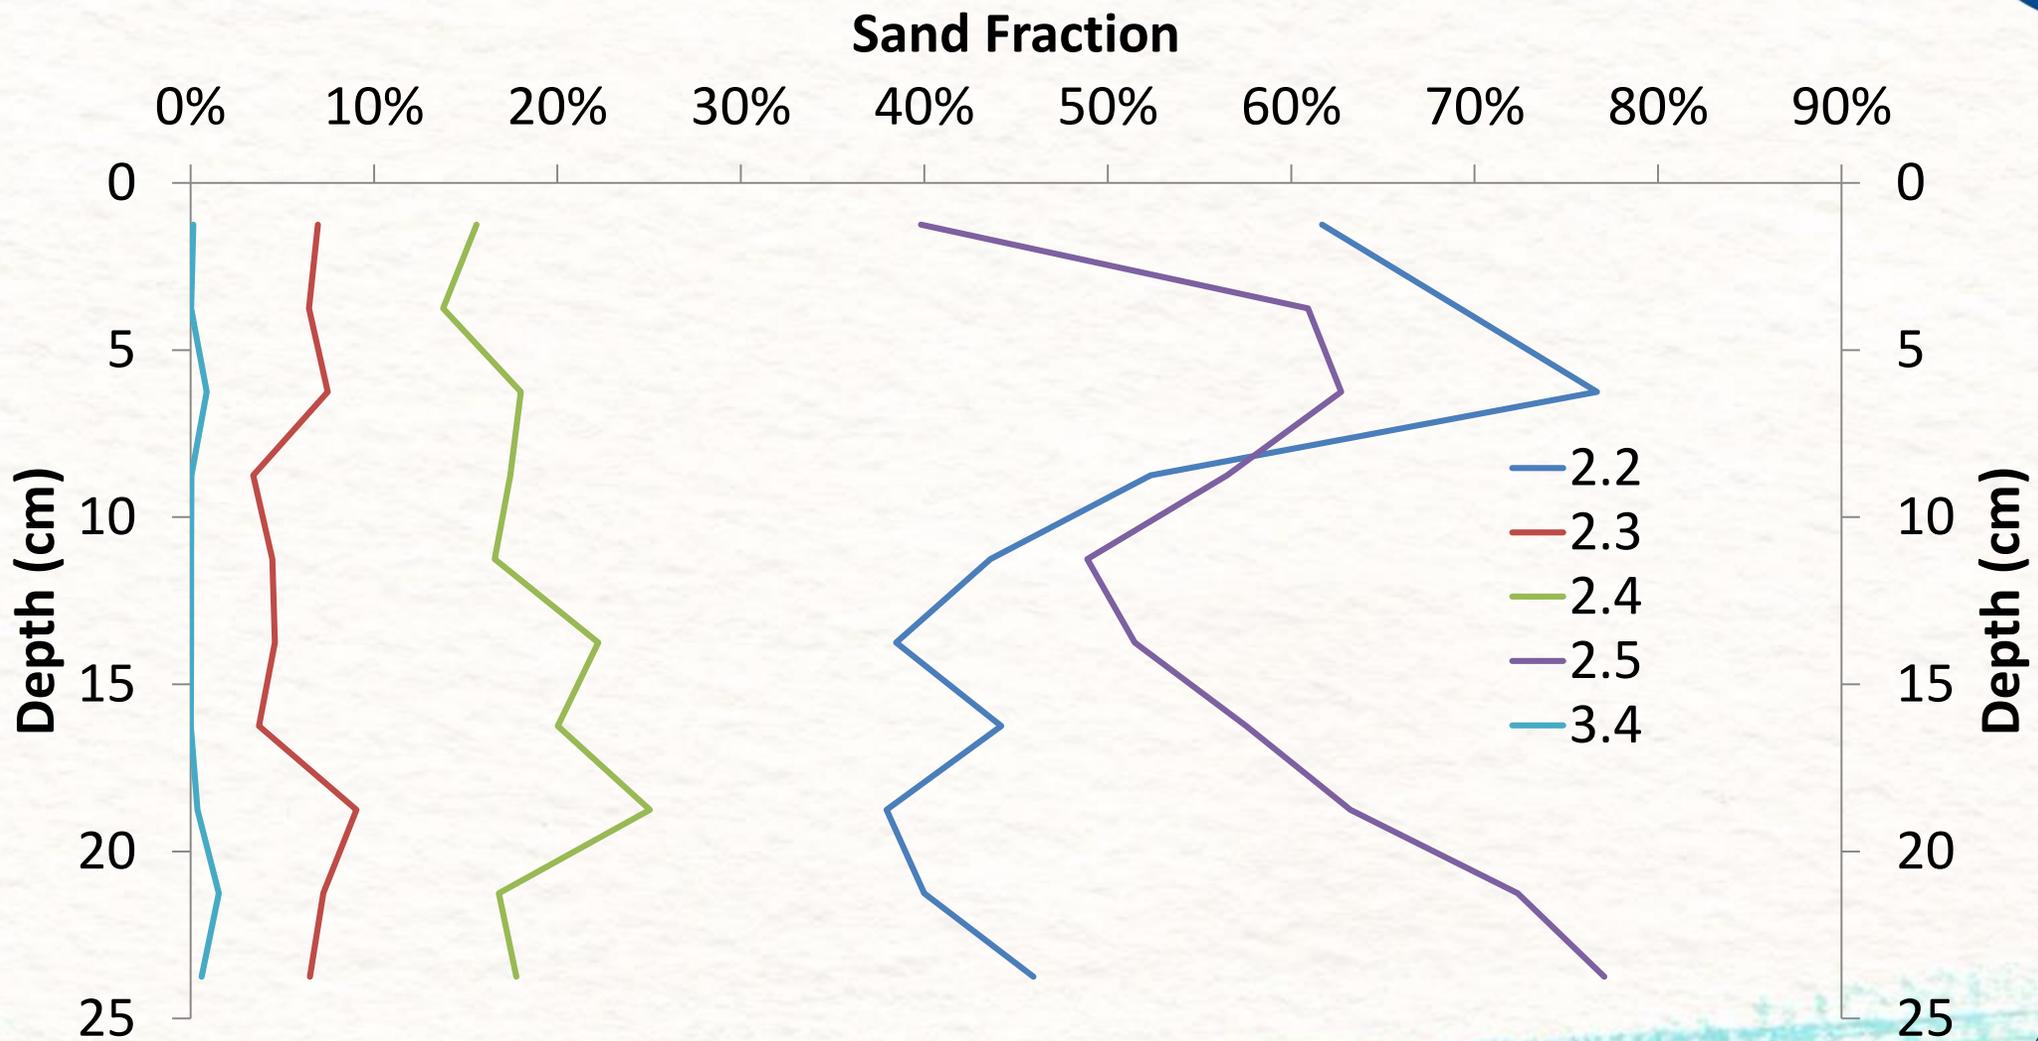

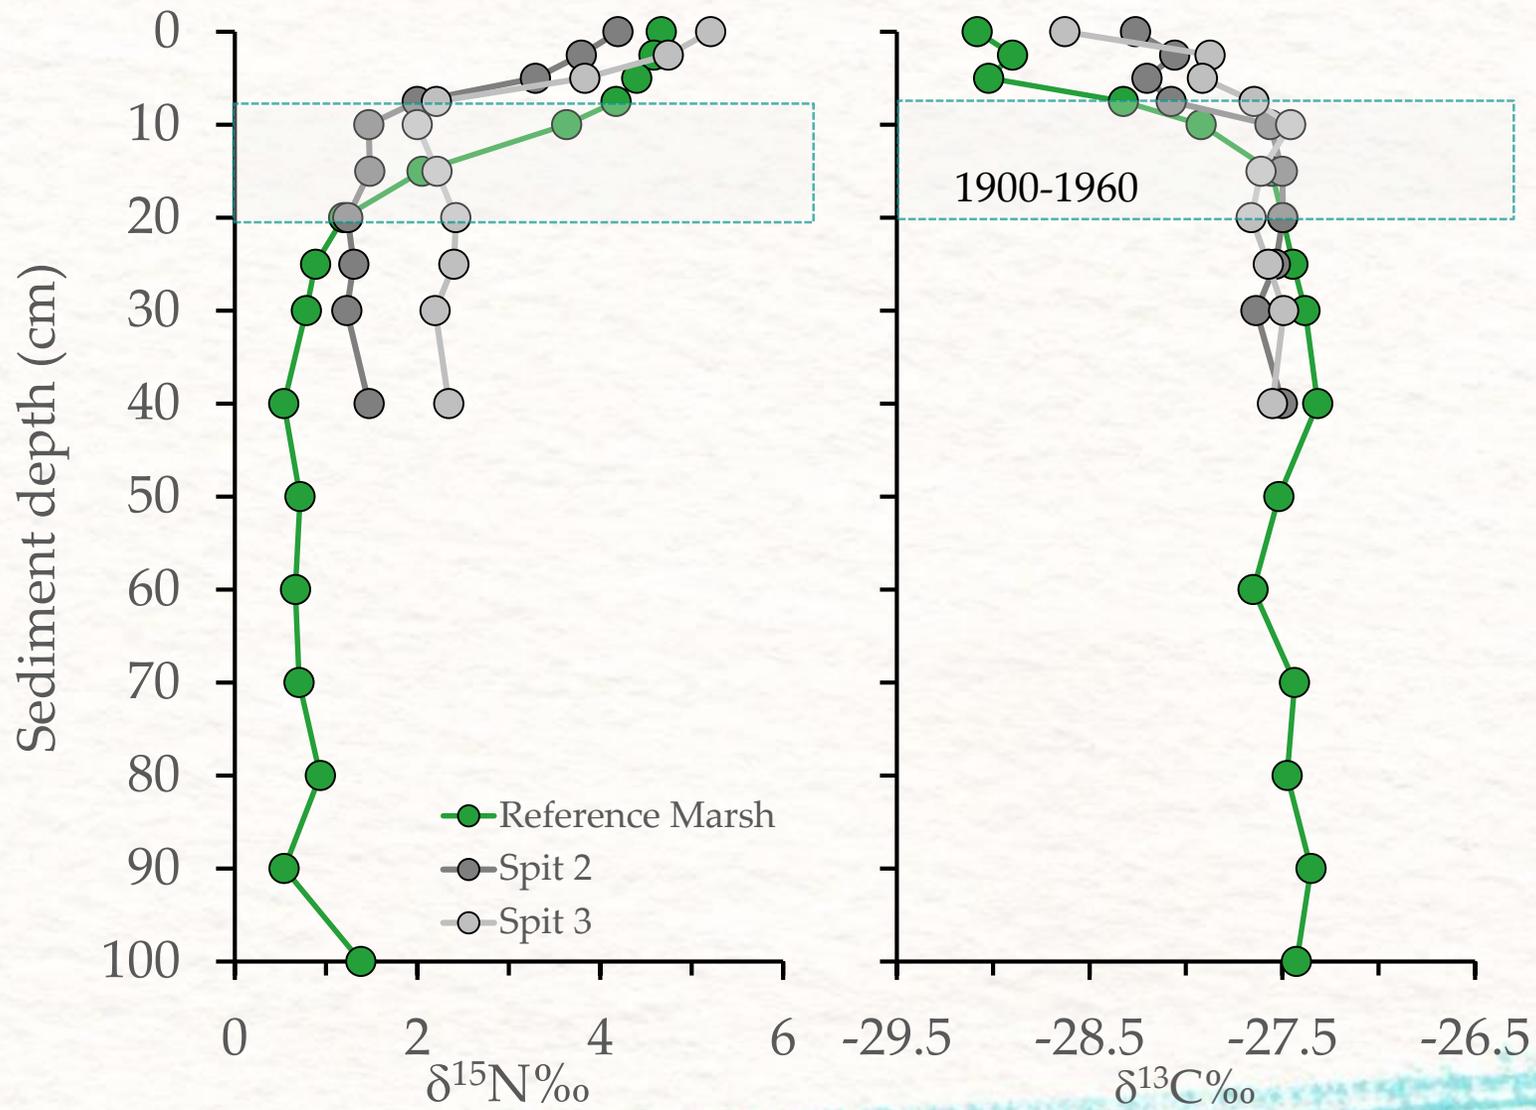

Fowl River Marsh Study - Sediment

Questions:

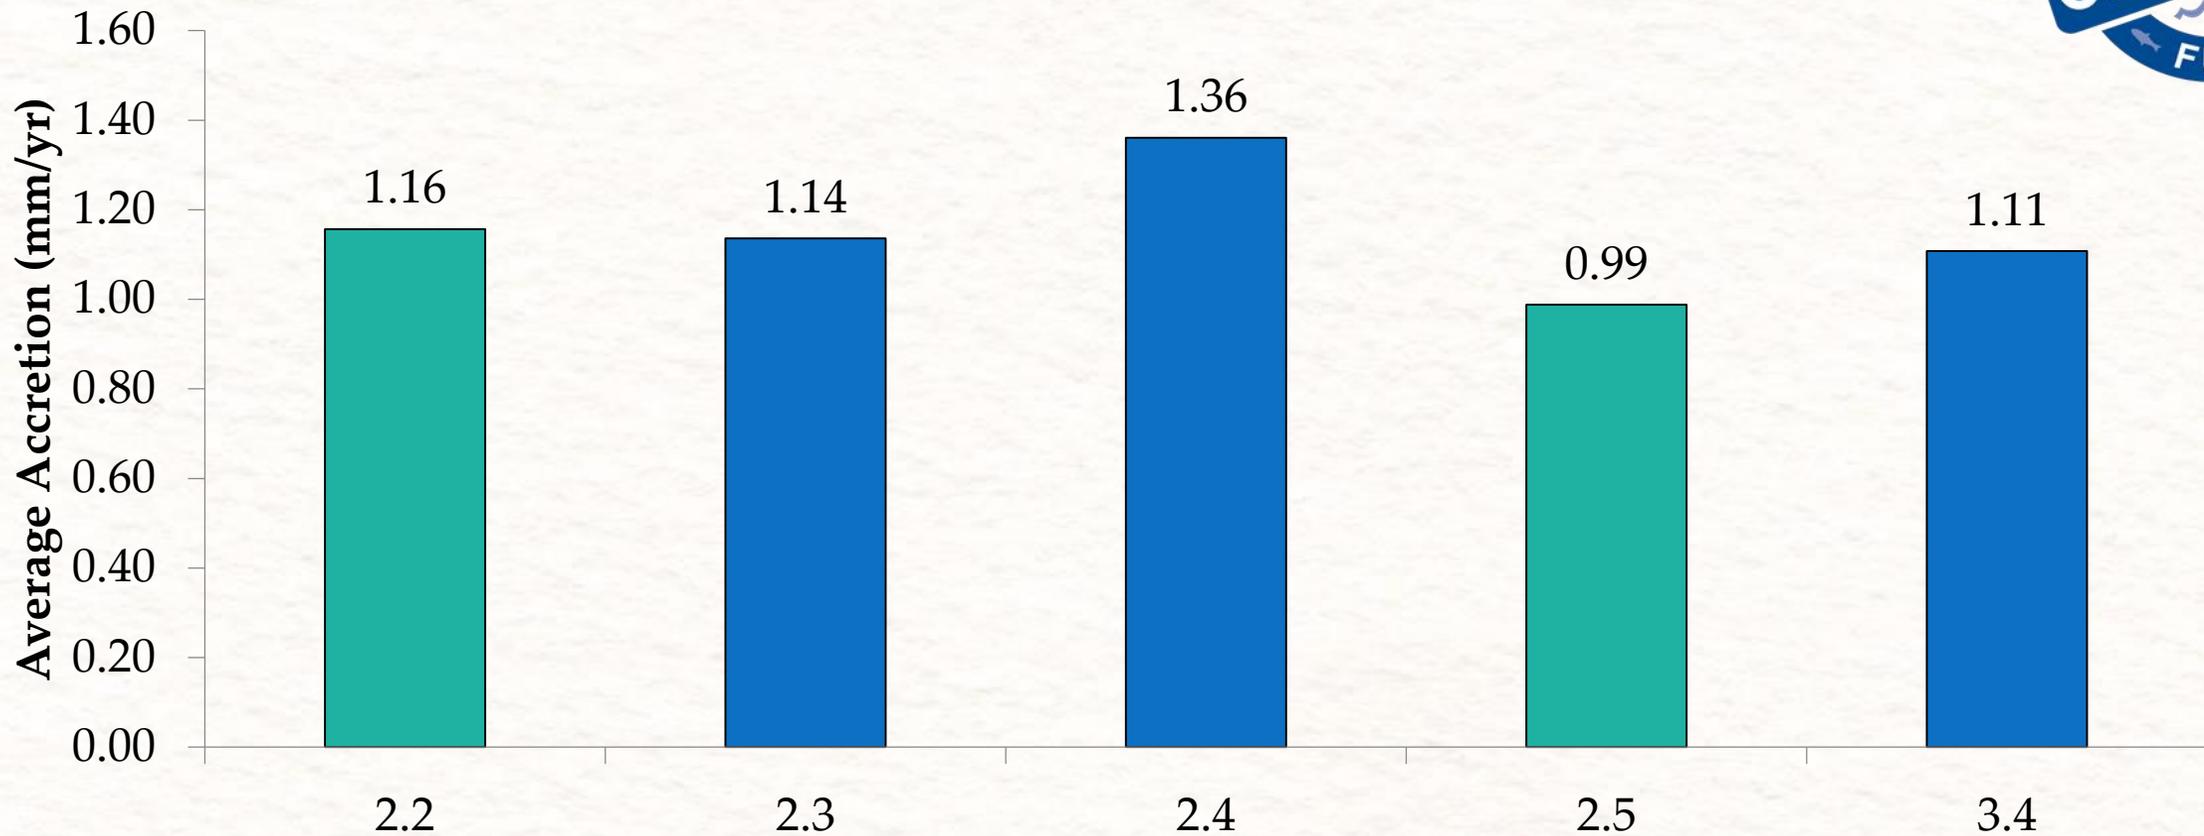

1. What is the current sediment supply, fate, and transport in Fowl river?

Very little sediment reaches the downstream areas (Regions 2 & 3)

2. How do the current sediment conditions compare to the past?

Same lithology (sediment type) but composition is changing

3. What are the accretion/erosion rates for the marsh?

Fowl River Marsh Study - Sediment

Questions:

1. What is the current sediment supply, fate, and transport in Fowl river?

Very little sediment reaches the downstream areas (Regions 2 & 3)

2. How do the current sediment conditions compare to the past?

Same lithology (sediment type) but composition is changing

3. What are the accretion/erosion rates for the marsh?

Accretion is not keeping pace with sea level rise (need sediment)

Boat Wakes in Fowl River

Stephanie M. Smallegan, PhD, PE, Bret M. Webb PhD, PE, DCE, Evan Mazur, Luke Lamonte

UNIVERSITY OF
SOUTH ALABAMA

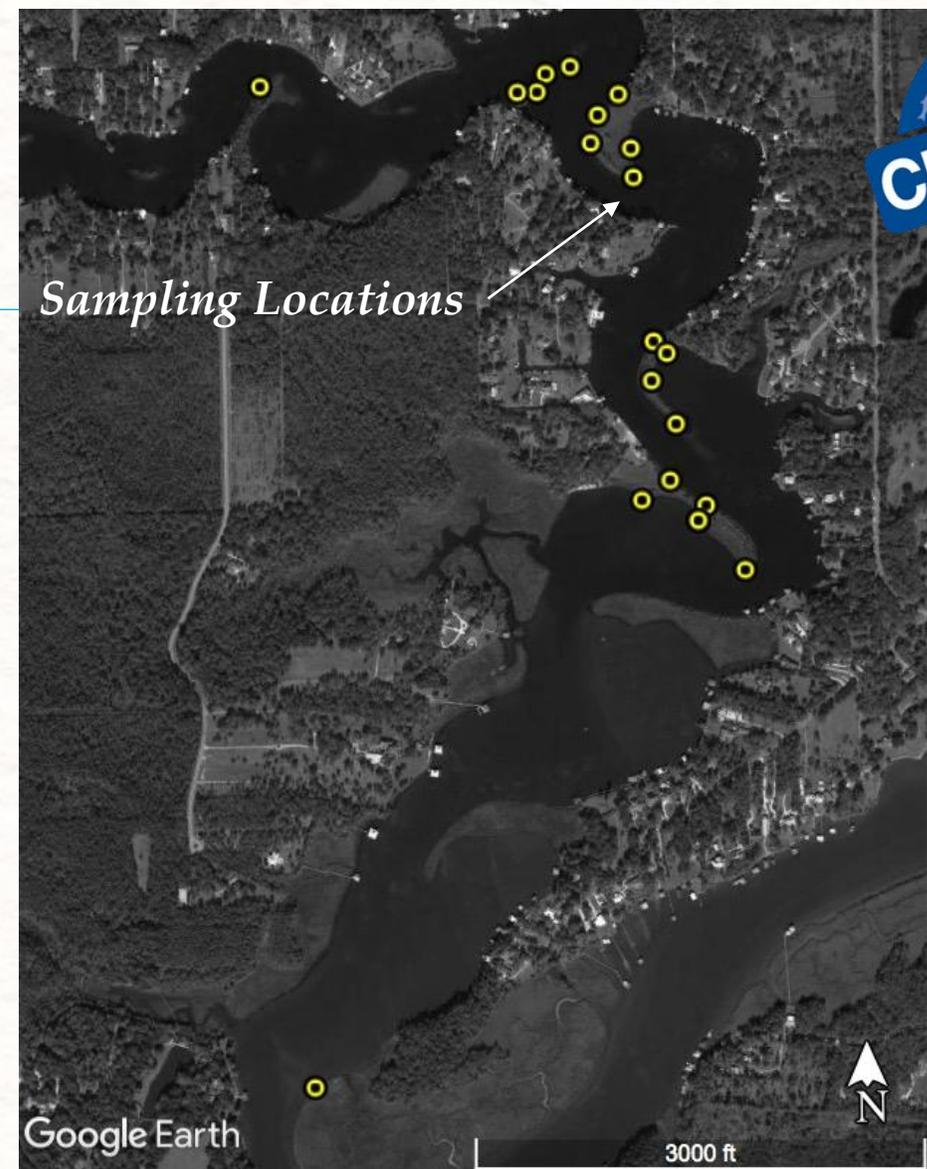

I. Objectives

- 01** Measure Tides and Waves
- 02** Evaluate Wave Conditions
- 03** Describe Wave Frequency
- 04** Inform Restoration Design

II. Study Information

Fowl River – North of Bellingrath

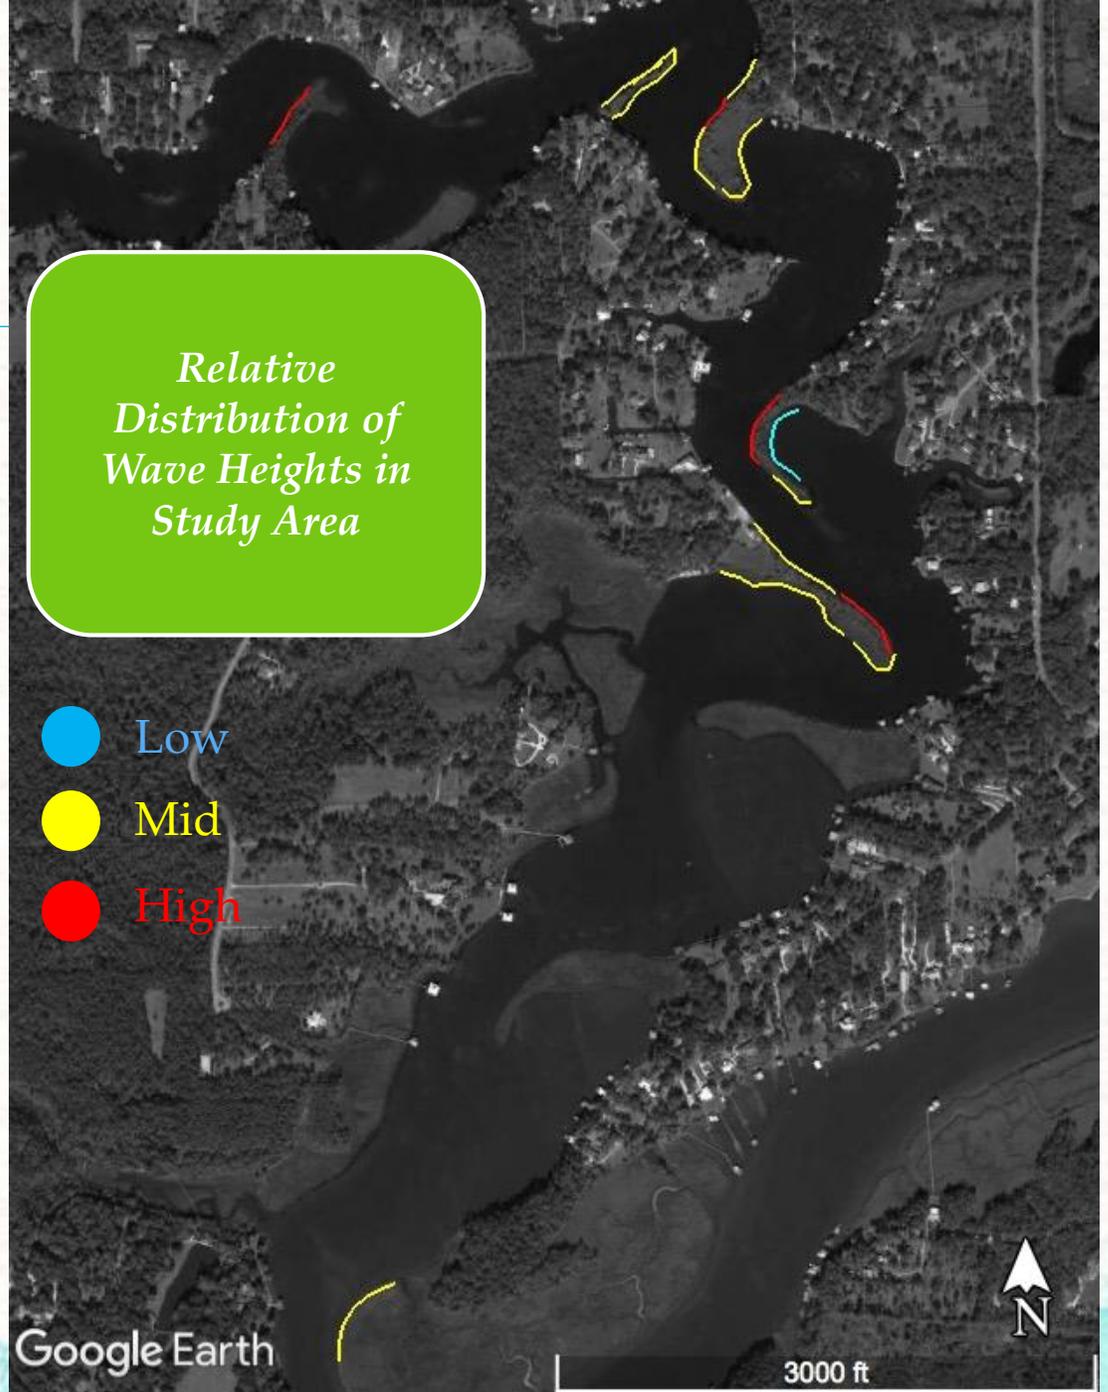

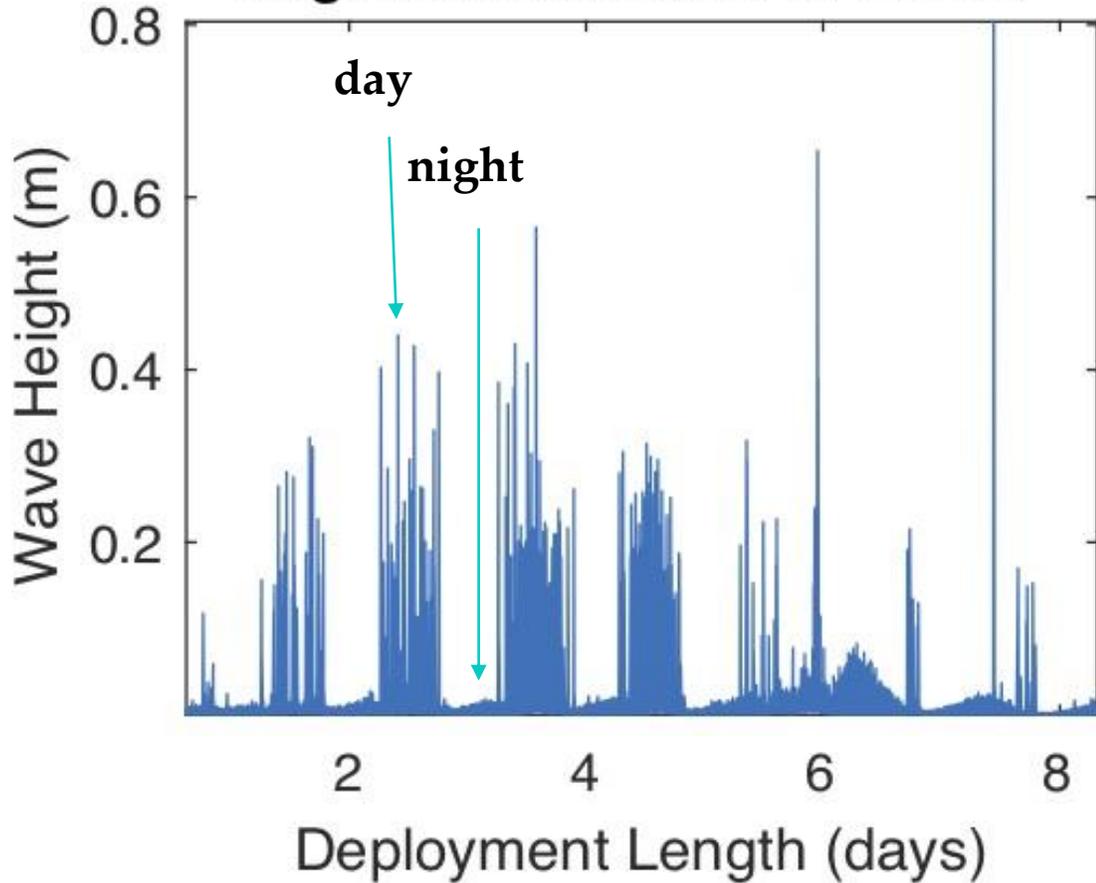

- May 24 – October 3, 2018
- Few data gaps
- Ten wave gages
- Some gage locations permanent
- Other gage locations rotated

III. Wave Heights

It's All Boat Wake!!!

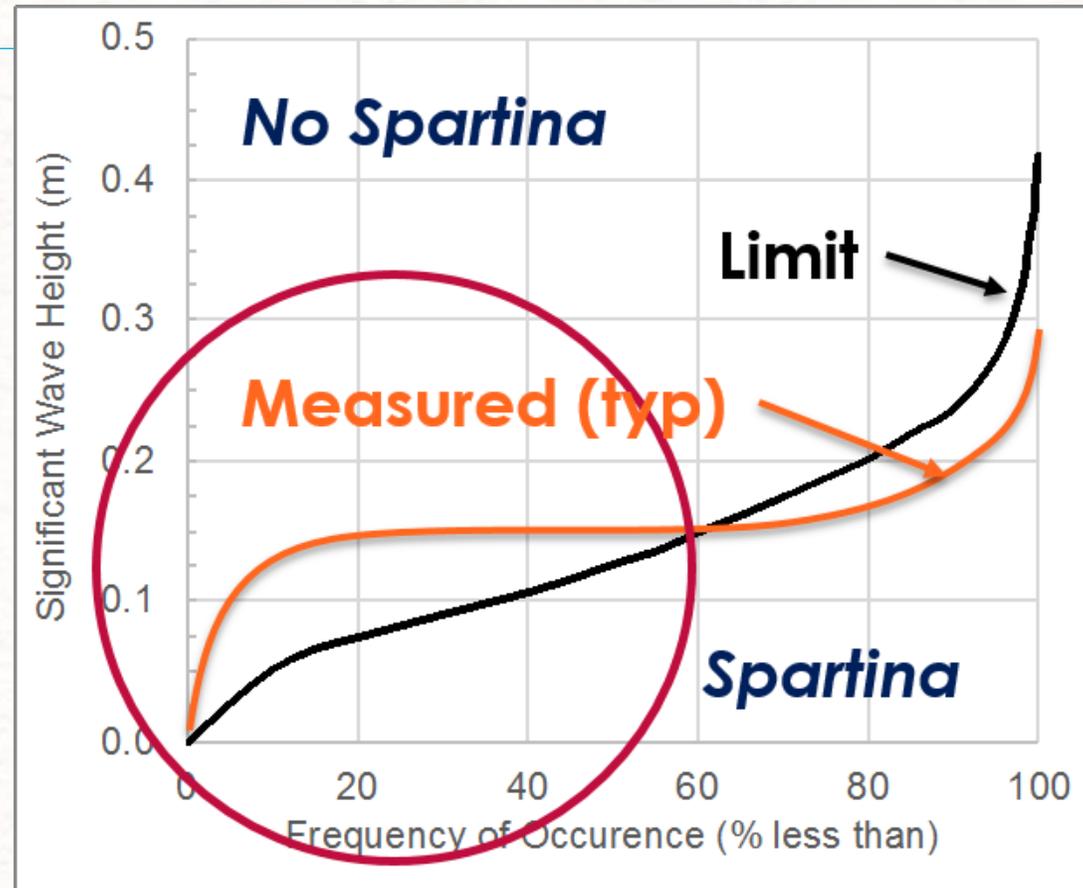

Gage 055139 | 8/30/18-9/7/18

IV. Wave Frequency

Focus on the Frequent Events

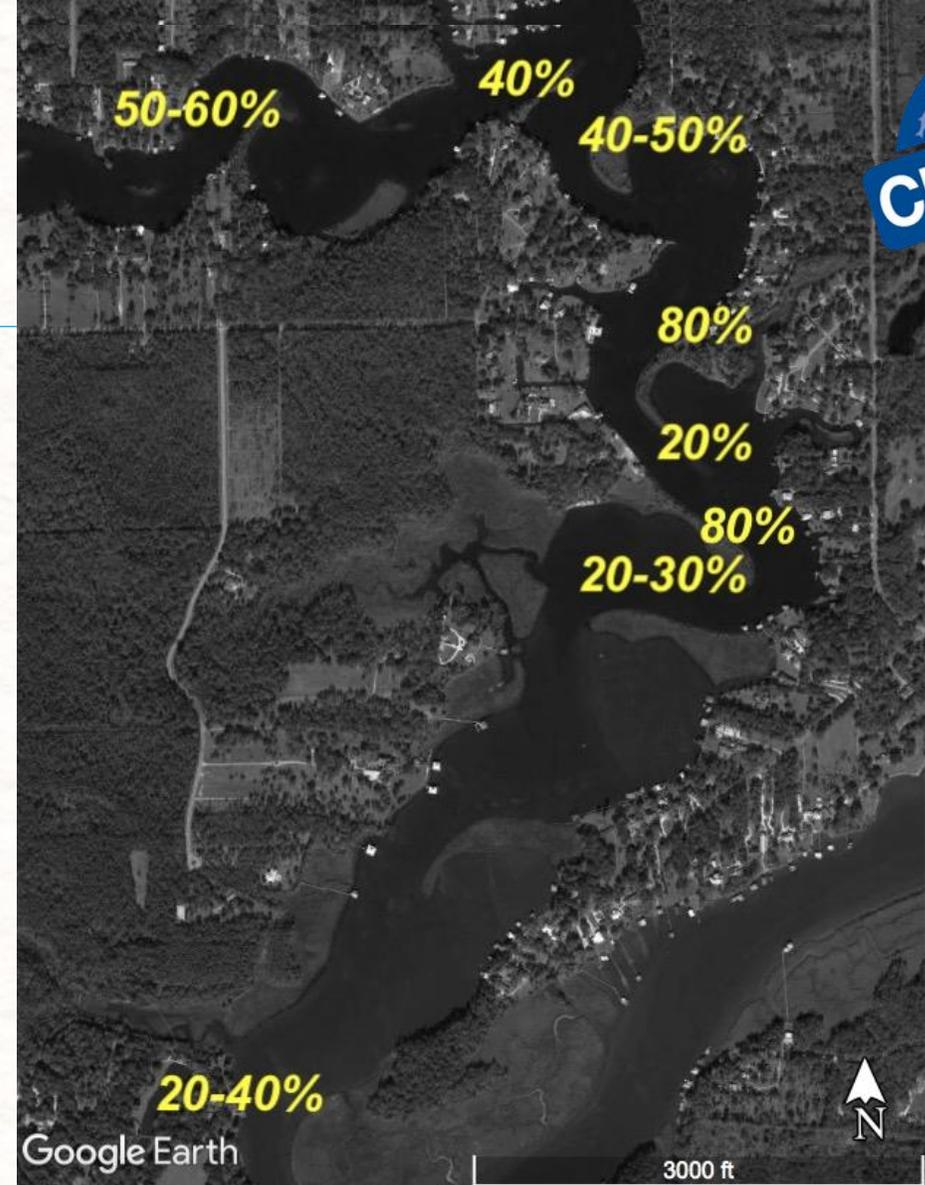

- Persistent wave action
- Exceeding limit most of the time
- Could this be contributing to erosion and loss of marsh?

IV. Wave Frequency

Exceedance Percentage Values

- All sites exceed limit for some amount of time
- Some sites exceed limit 80% of the time
- No site experiences extremely large waves

Key Points

Wave
Statistics

*All Boat Wake!
Wave Heights Small*

Wave
Frequency

*All Sites Exceed 20%
Some Sites Exceed 80%*

Restoration
Implications

*Small Structures

Sea Level, Salinity, Suspended Sediments and Nutrients

John Lehrter, Brian Dzwonkowski, Alexis Hagemeyer, and Jeff Coogan

Questions and Hypothesis

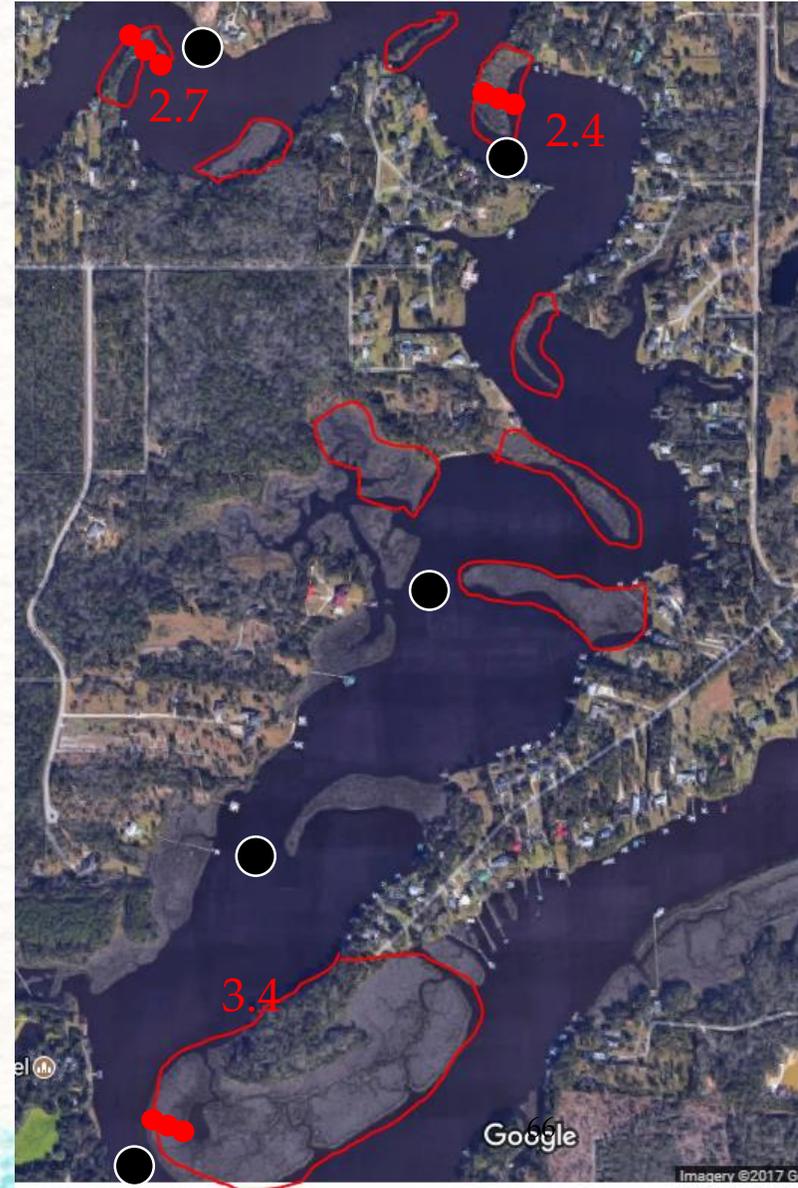

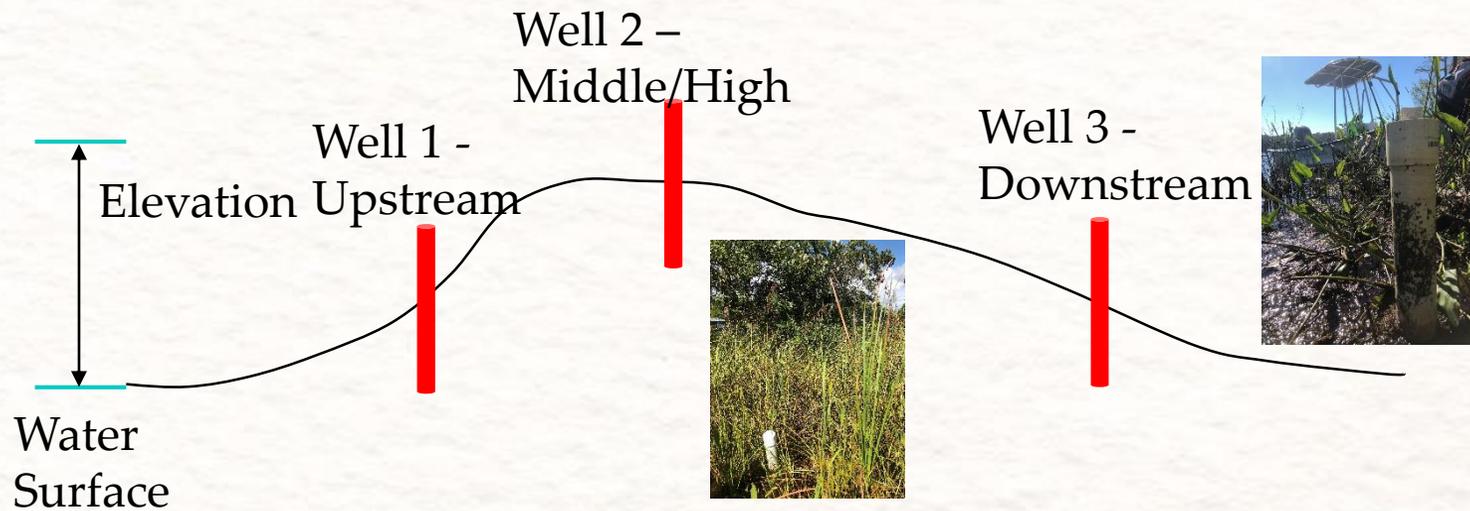

- **How are changing marsh spits related to sea level rise, salinity, and nutrients?**
 - Flooding due to sea level rise (Reed 2002)
 - Porewater salinity drives the growth and distribution of *Juncus roemarianus* (Eleuterius 1984) and other estuarine vegetation (Howard and Mendelssohn 1999)
 - Sedimentation rates (Stumpf 1983)
 - Shoreline change and loss caused by nutrient over-enrichment (Deegan et al. 2012)
- Can we diagnose causes for loss of spit shoreline by process of elimination?
How may we restore Fowl River spits in consideration of environmental change?

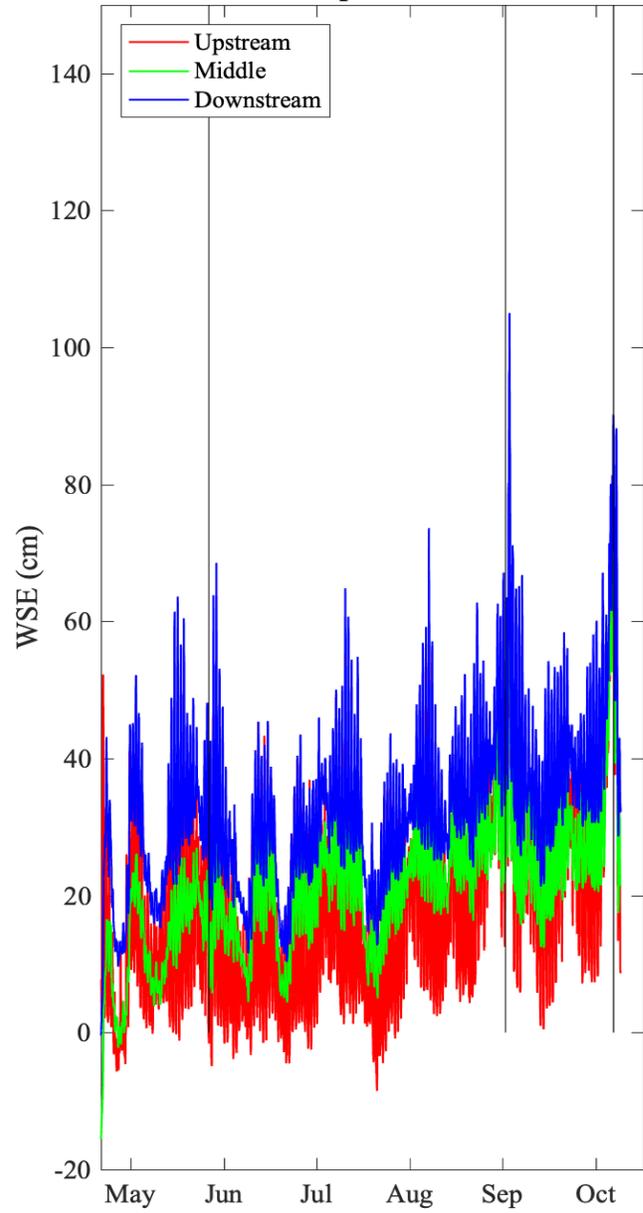

Jones and Tidwell (2012); Fowl River Watershed Management Plan (2016)

Methods – Fowl River Marsh Hydrography

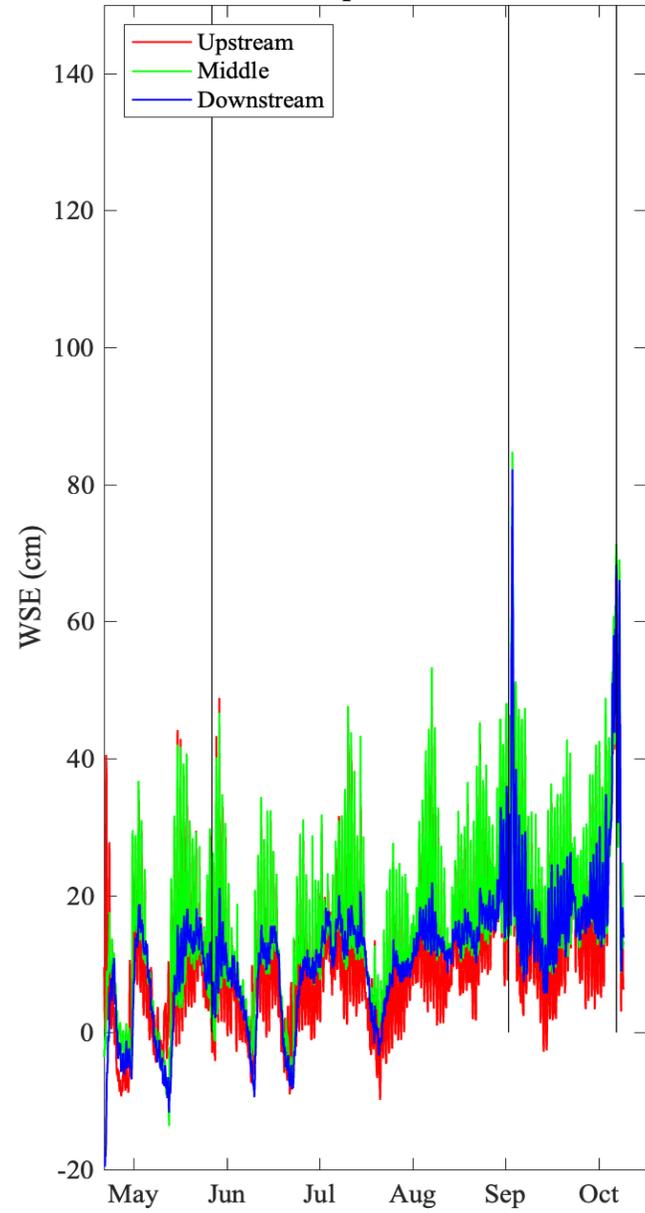

- Continuous measurements from Apr to Oct 2018
- 3 marsh spits with porewater wells
 - Three wells per spit across elevation gradient
 - Surveyed points with real-time kinematic (RTK) GPS
 - Instrumented with data loggers for depth and salinity

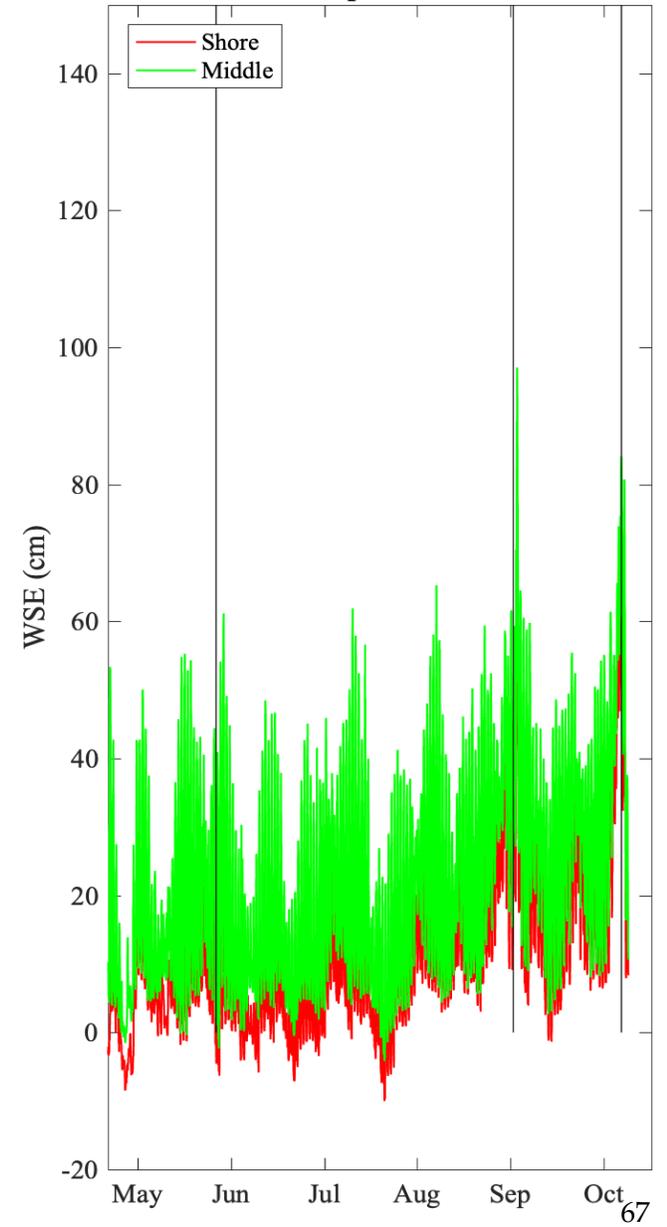

Spit 2.7

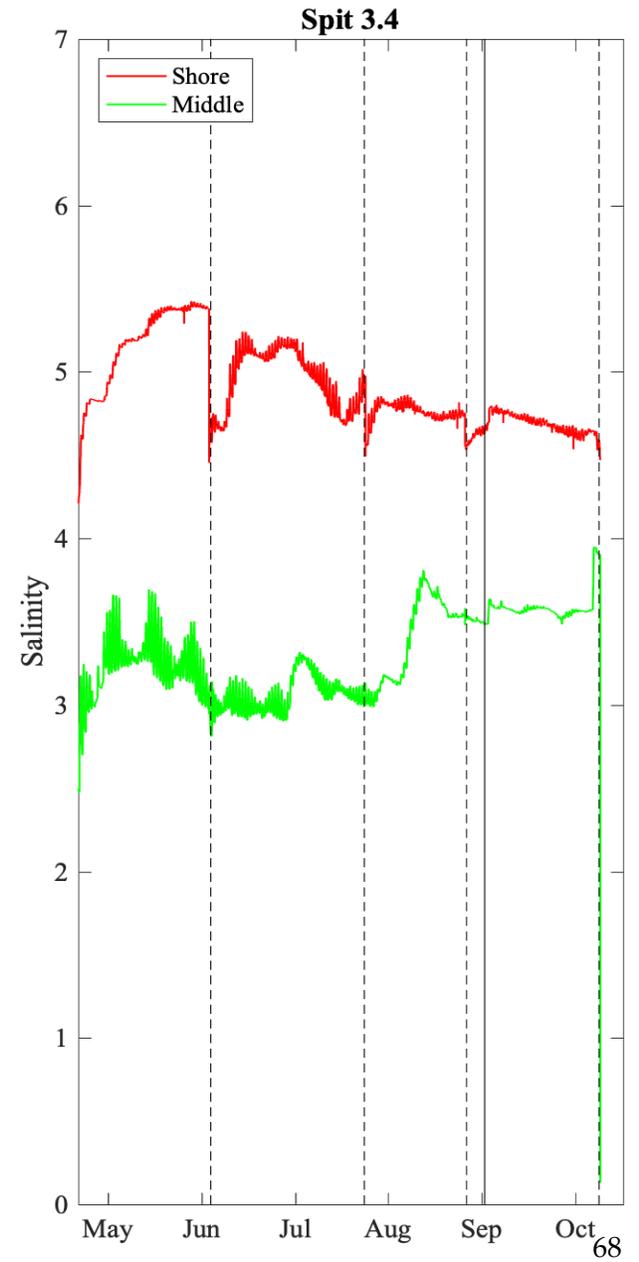

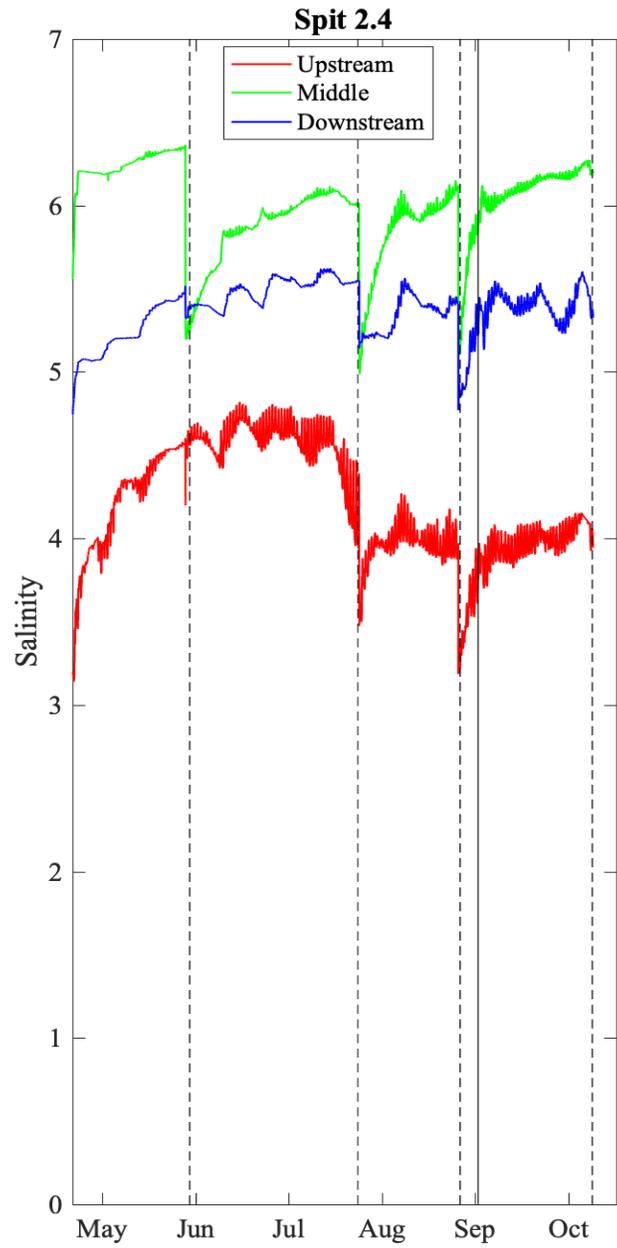

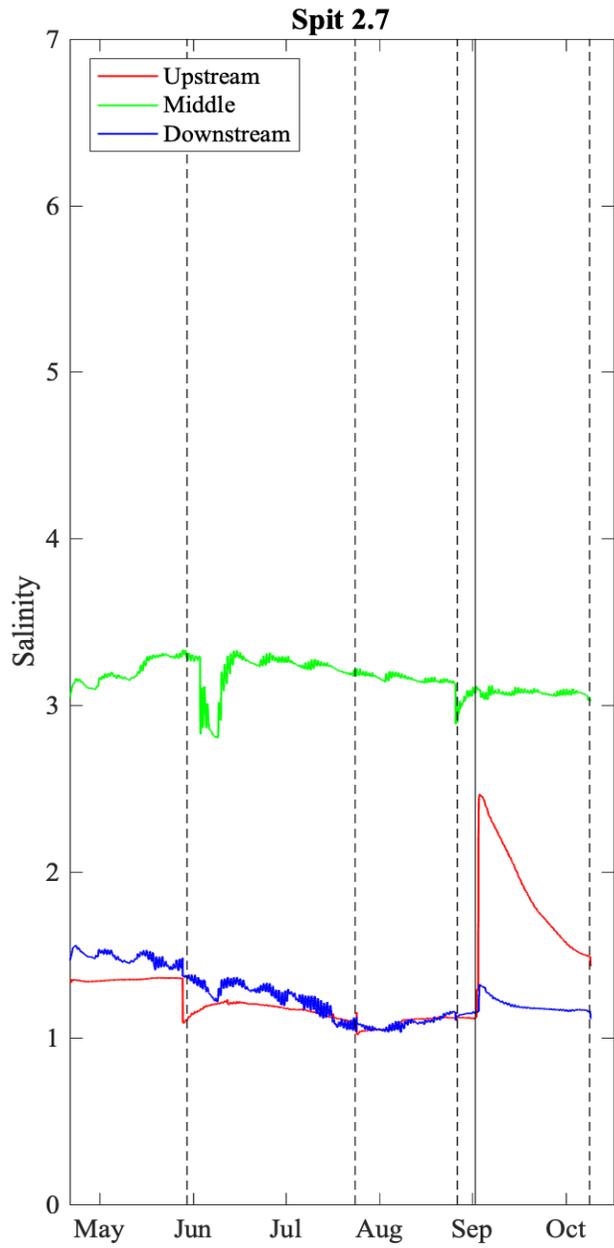

Spit 2.4

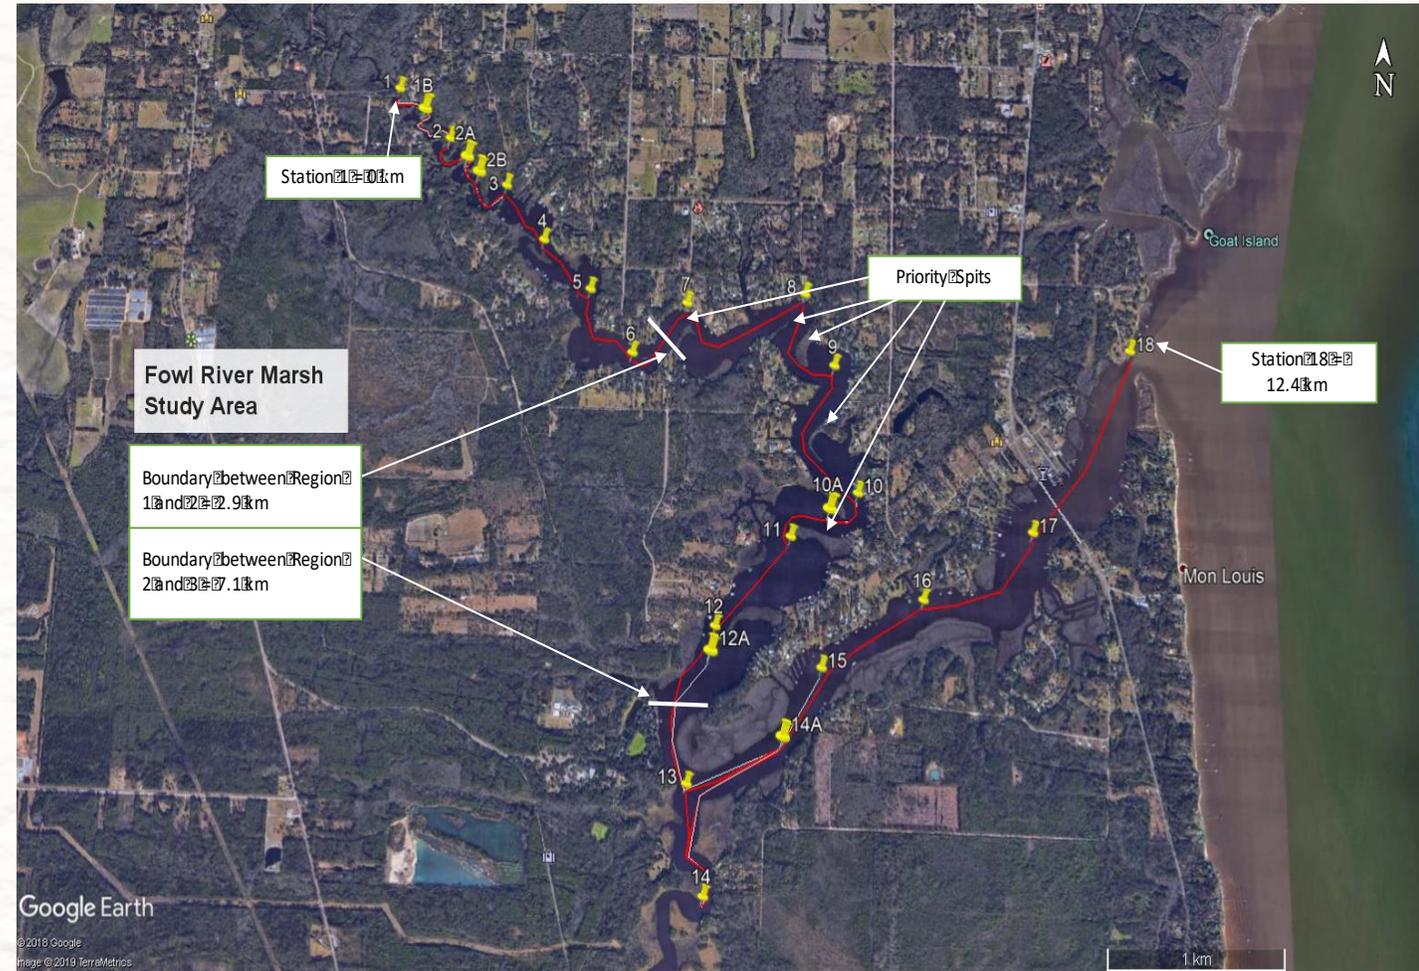

Spit 3.4

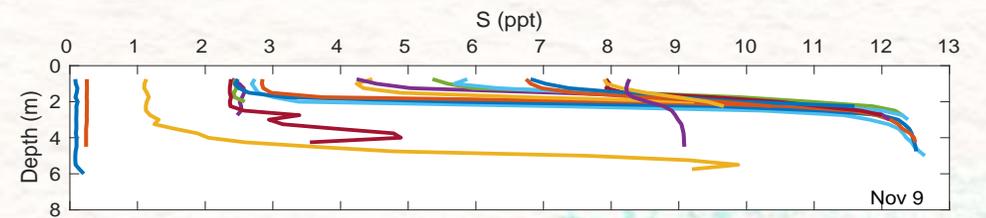

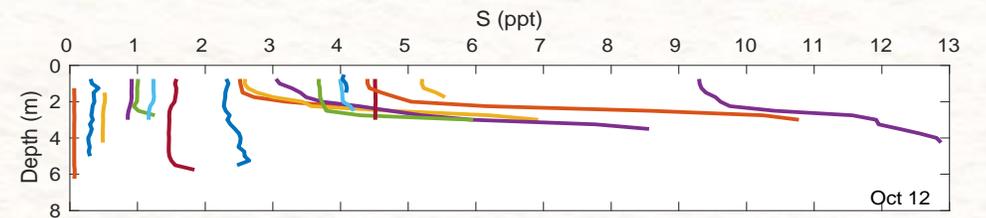

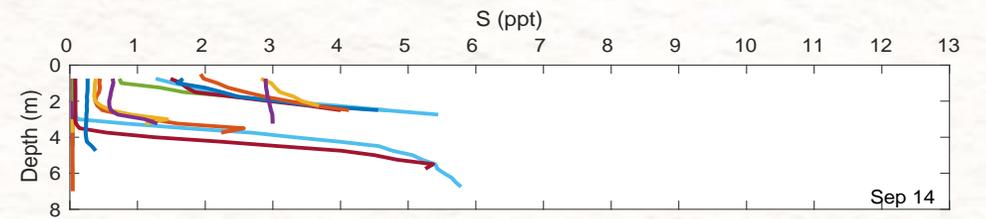

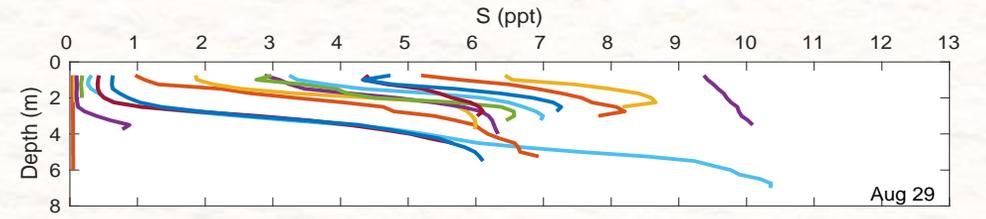

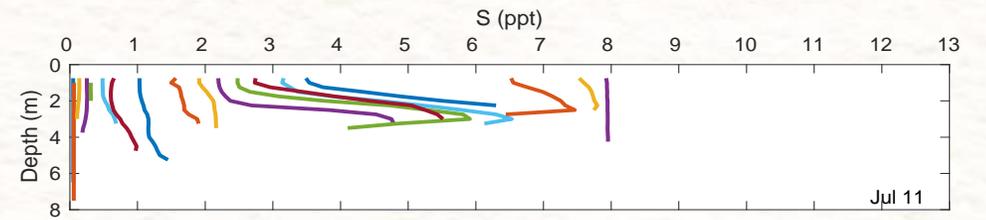

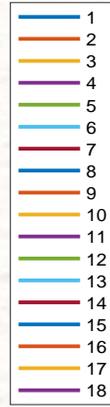

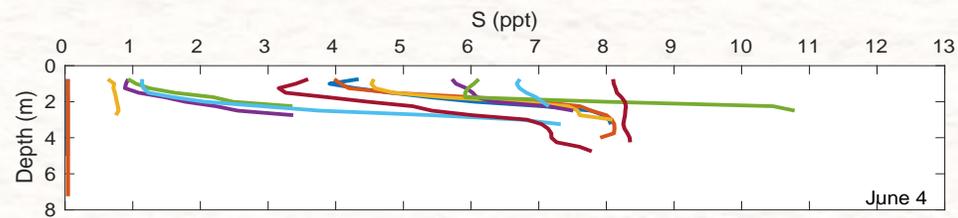

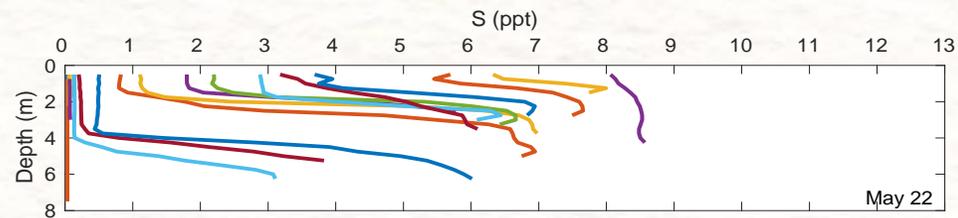

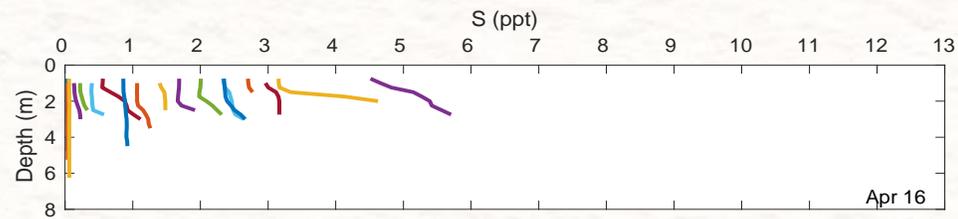

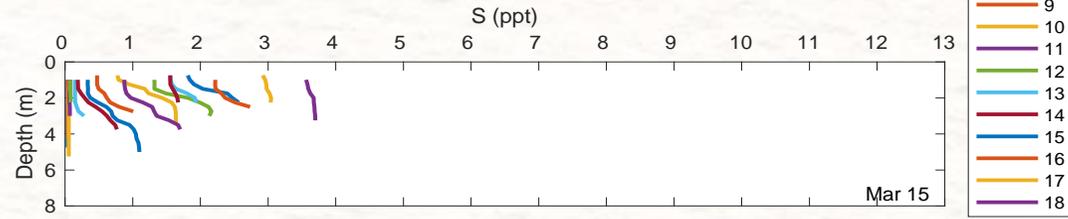

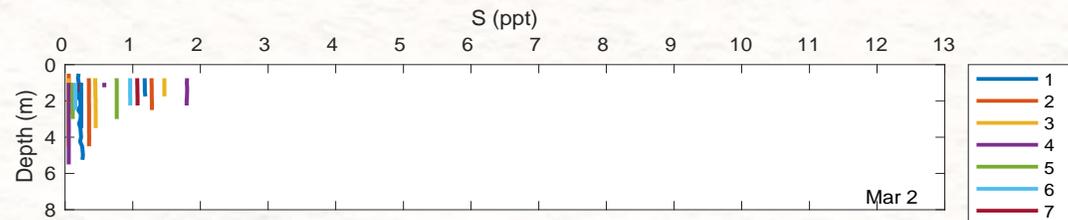

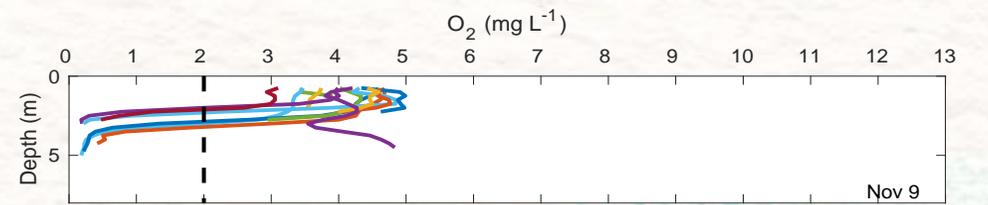

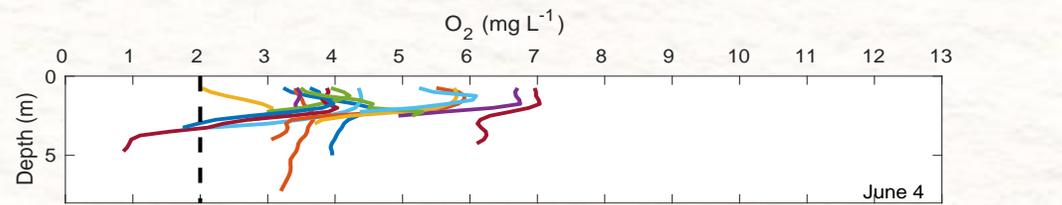

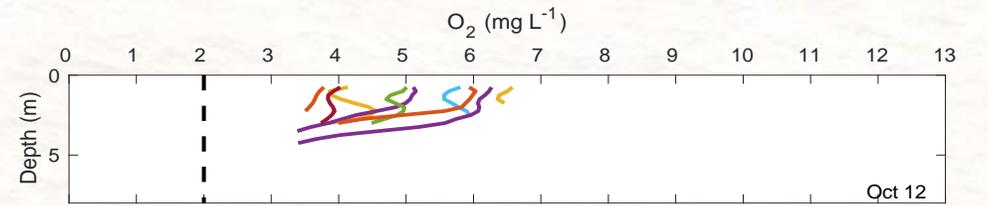

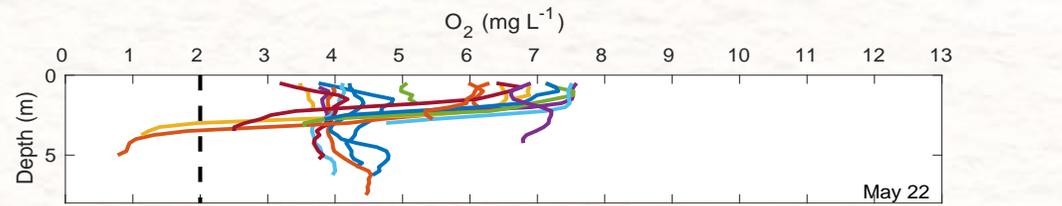

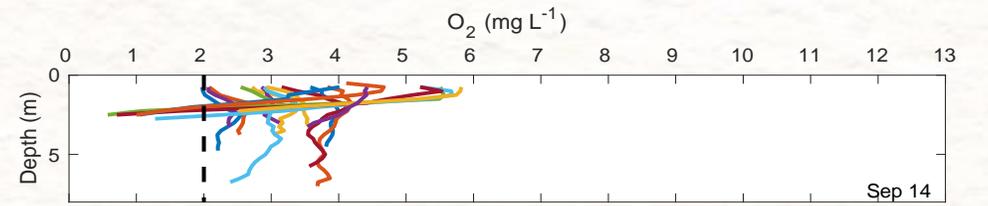

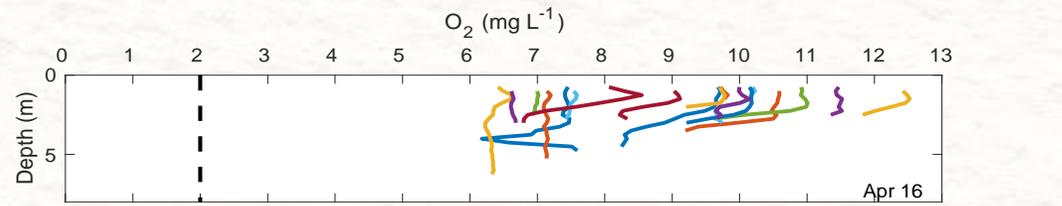

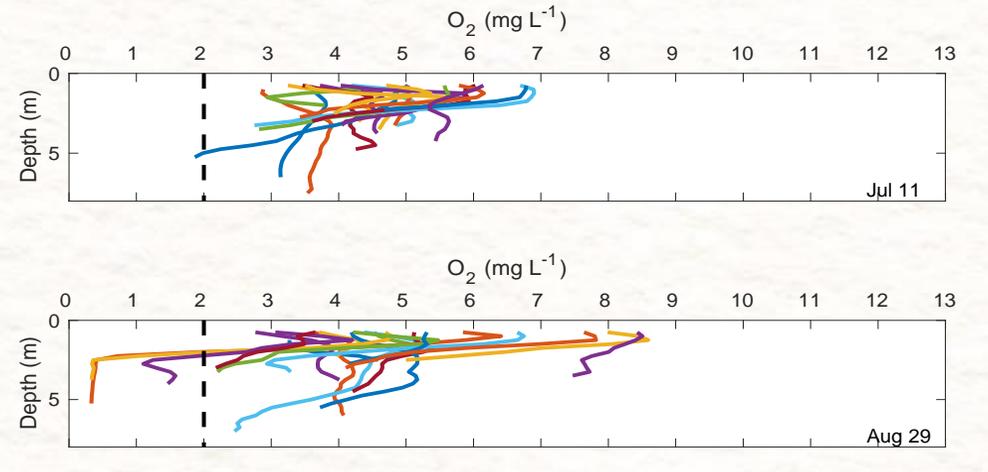

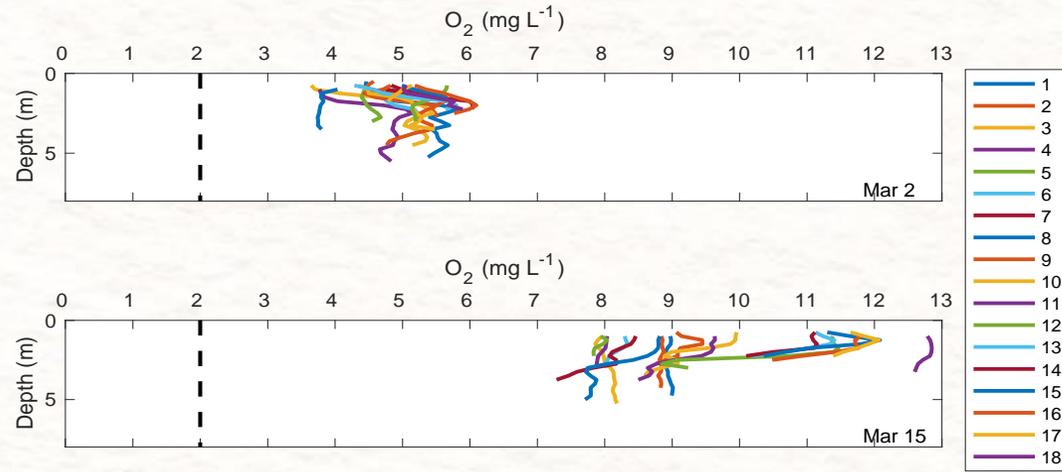

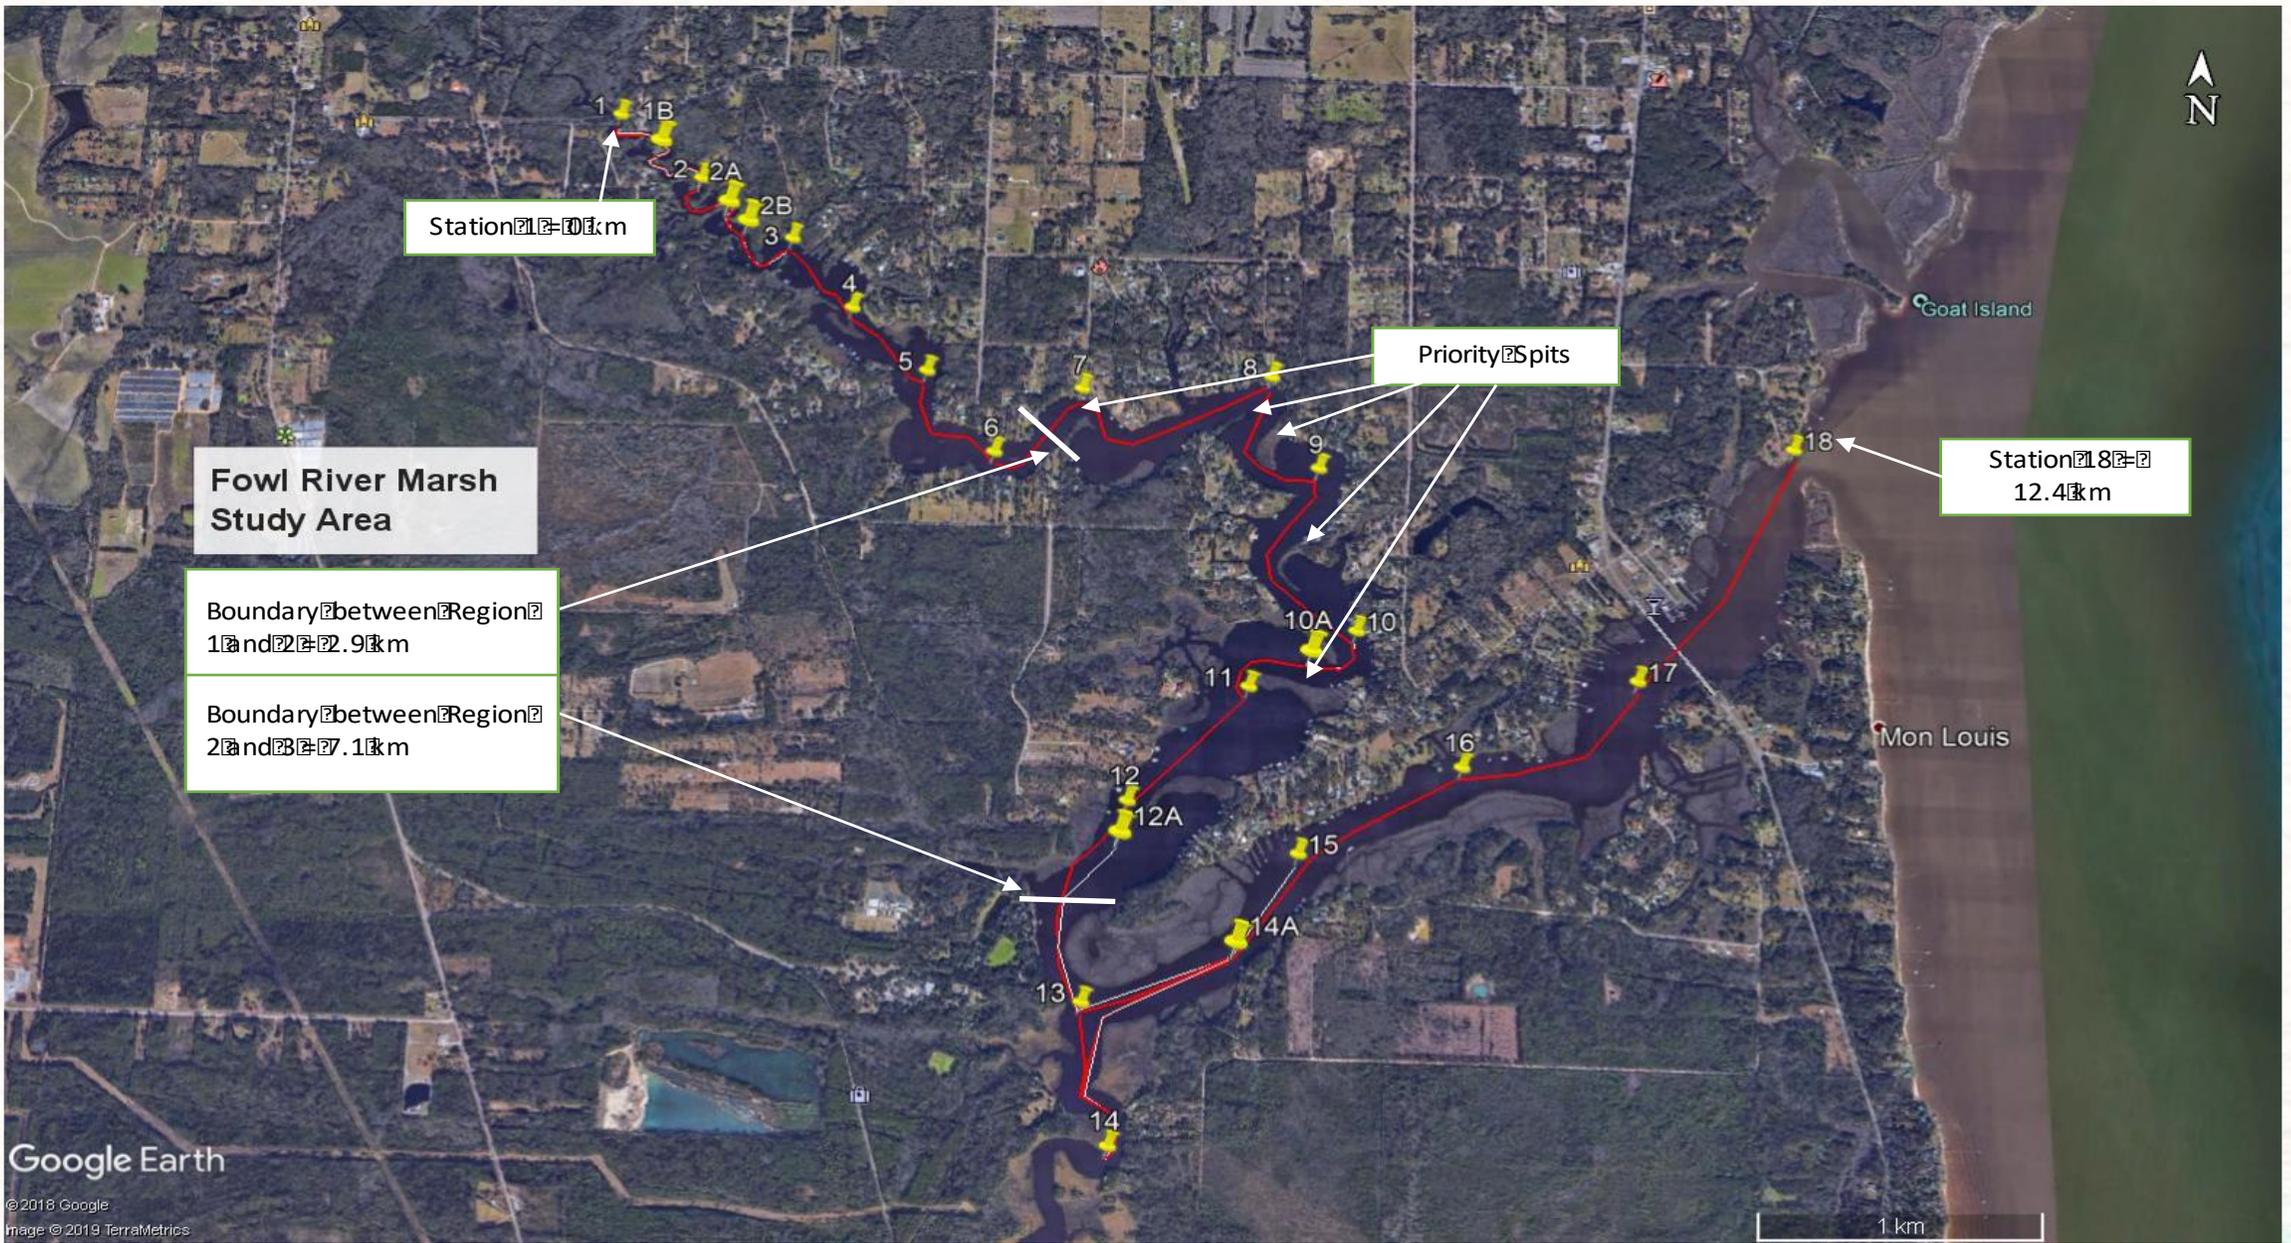

Methods – Fowl River Estuary Hydrography

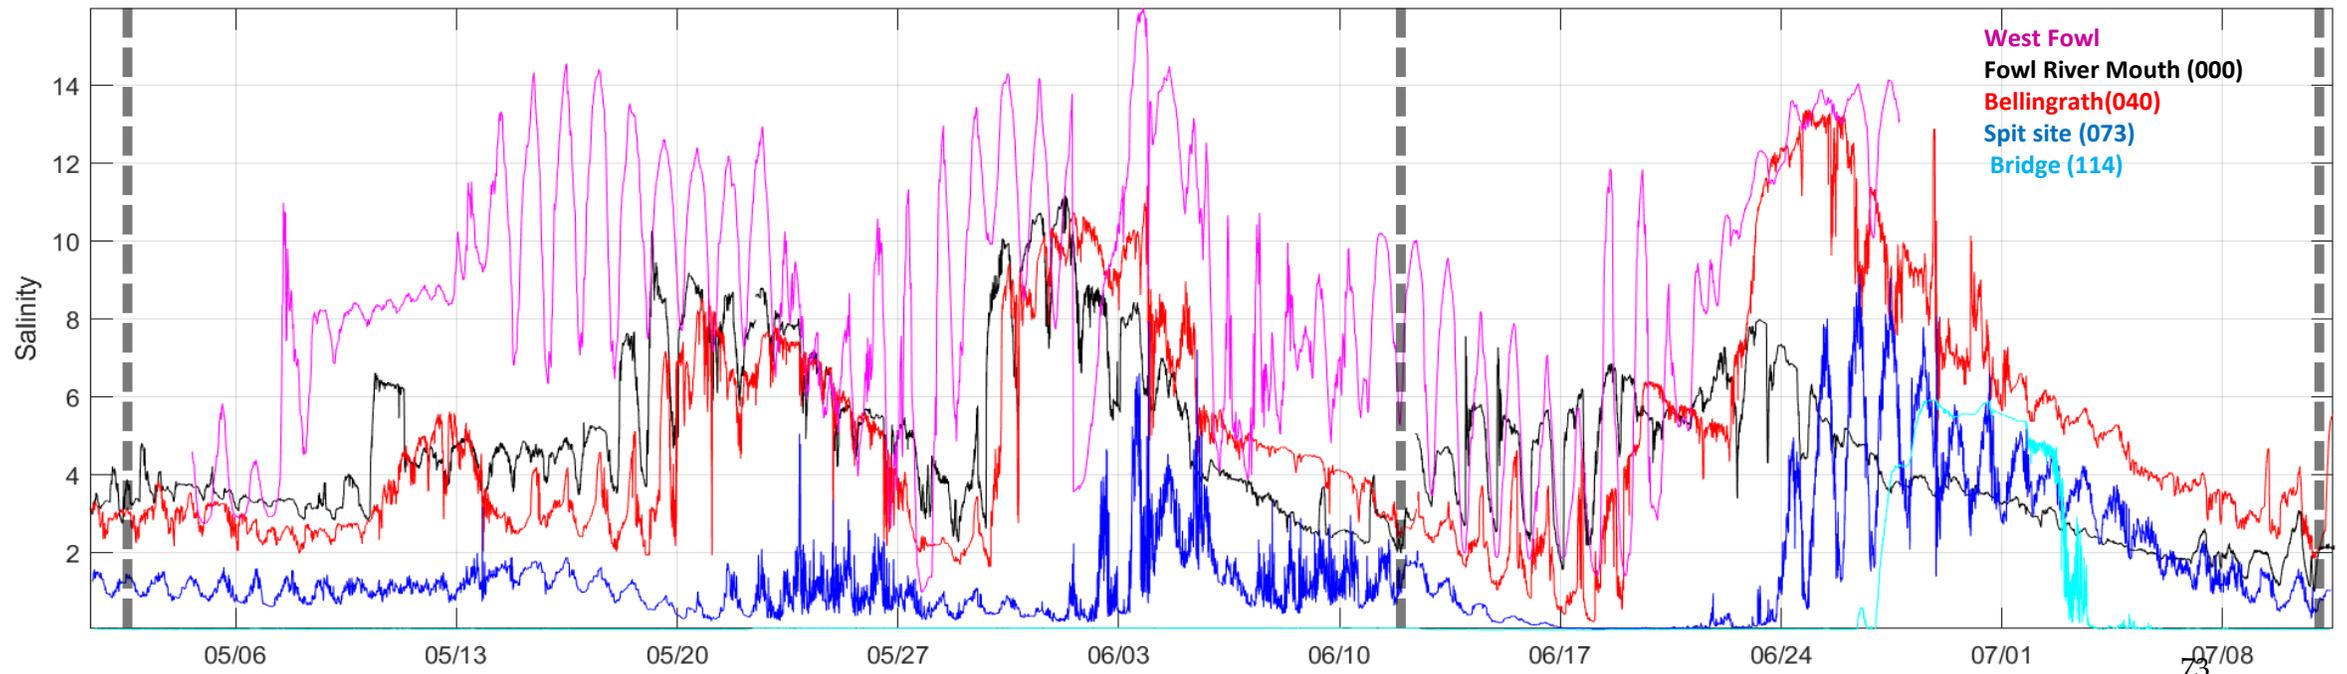

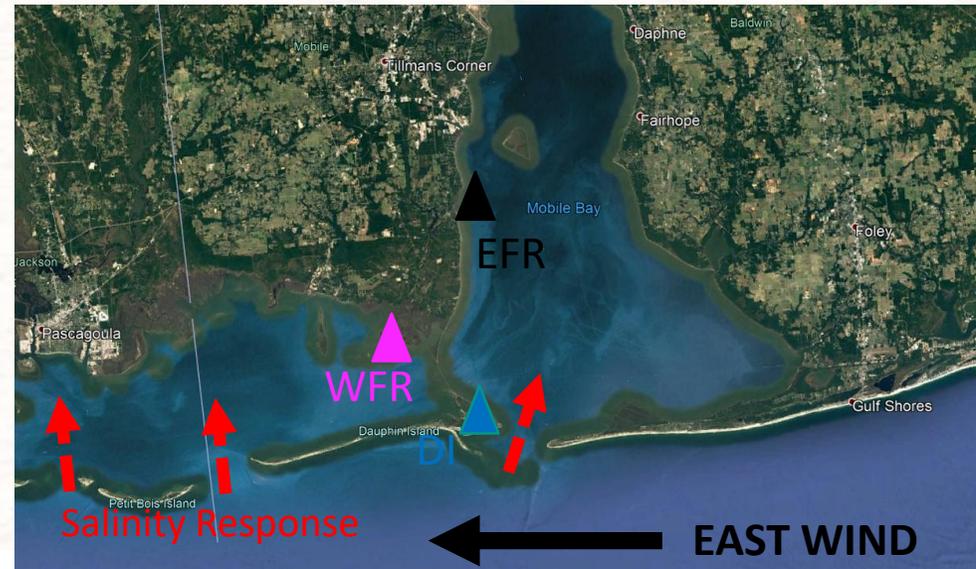

- Monthly surveys from Jan to Oct 2018
- 18 stations
 - CTD vertical profiles: S, T, depth, O₂
 - 8 discrete water sampling stations
 - Suspended sediments, nutrients, organic matter, Chl*a*
 - Surface and bottom samples

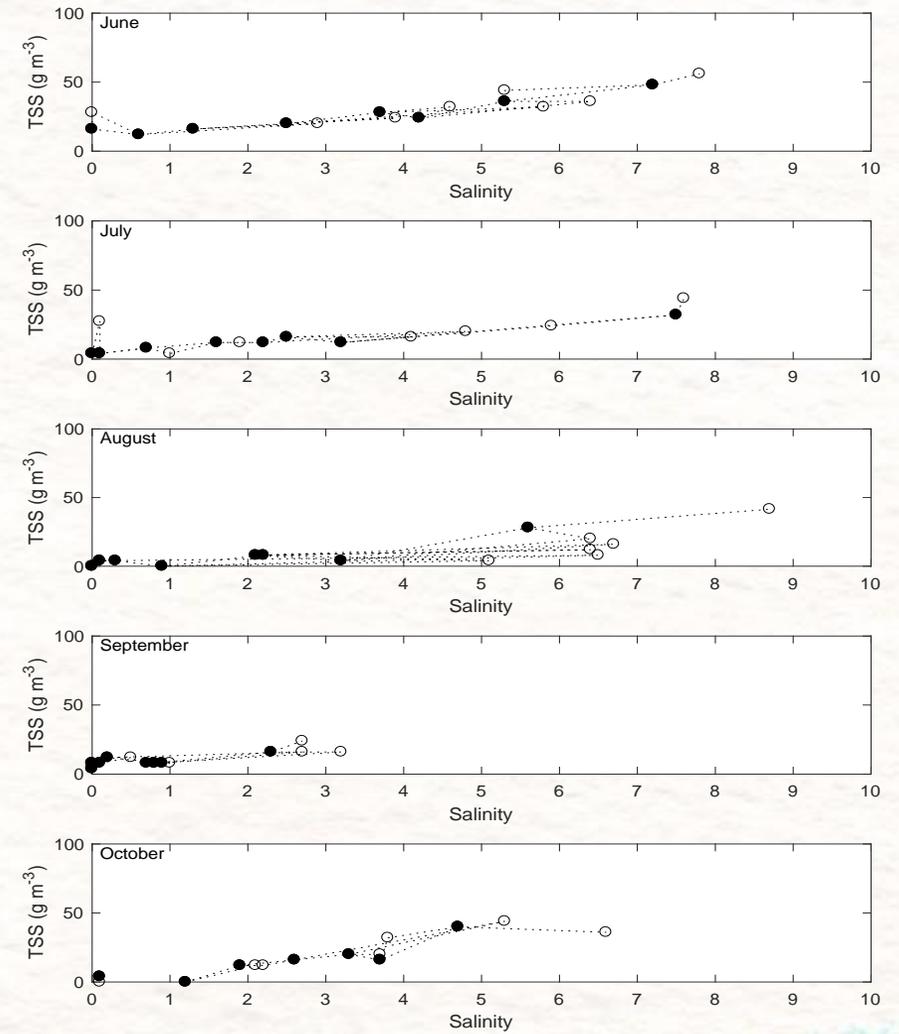

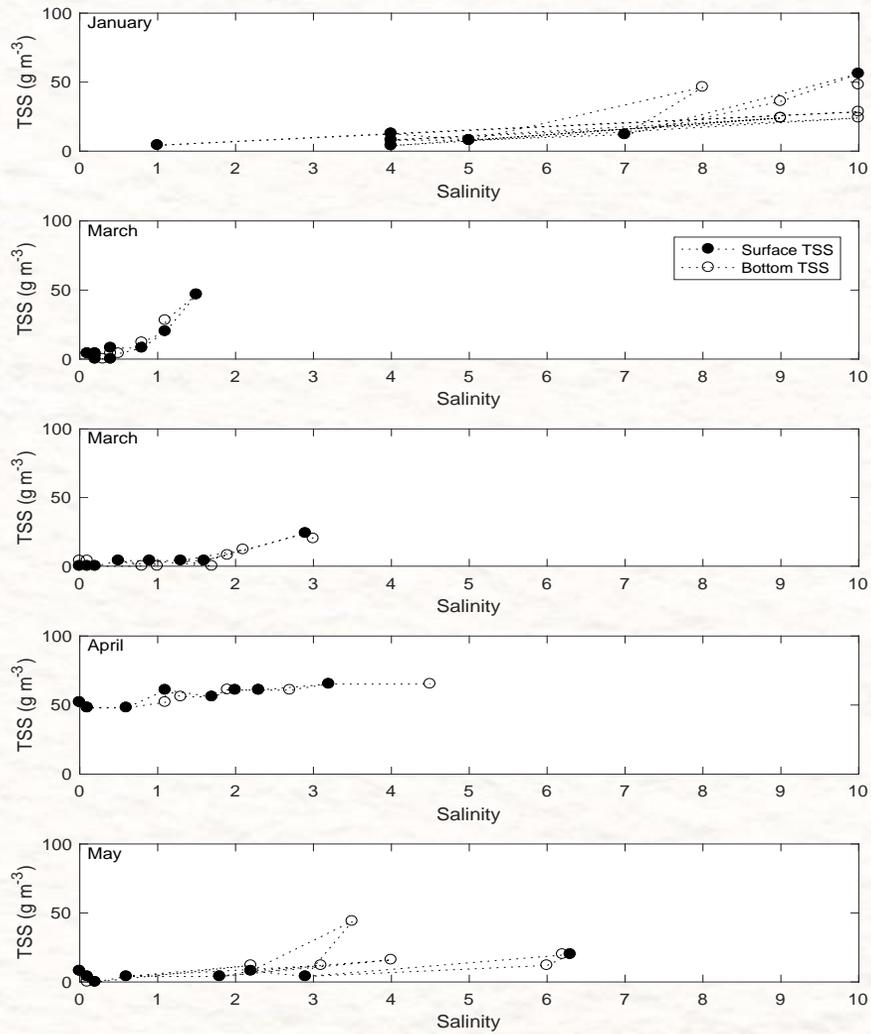

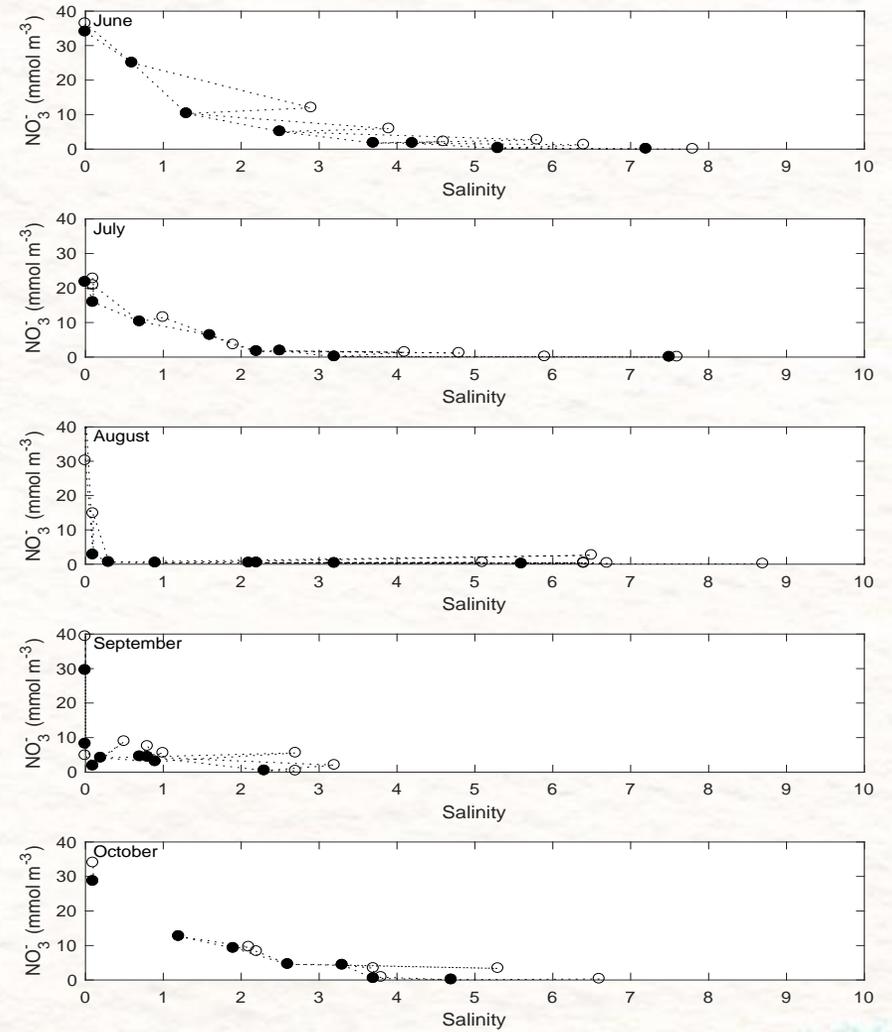

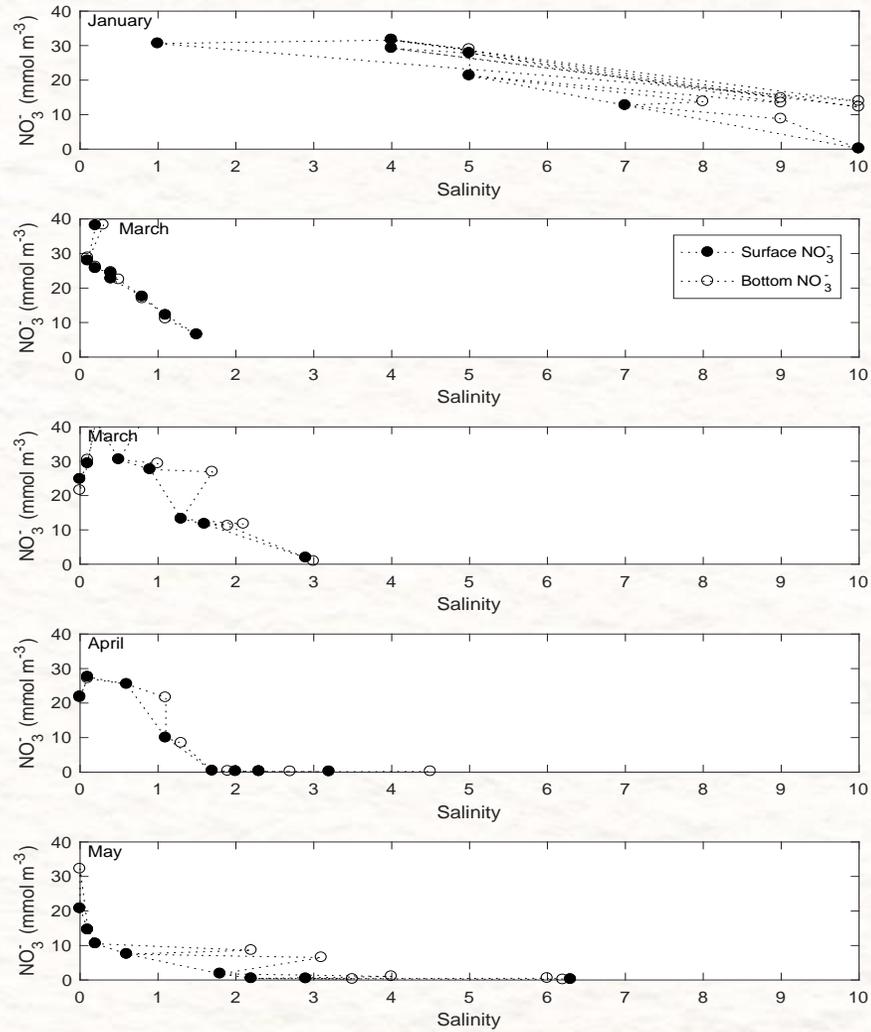

Suspended Sediment

Nitrate

Conclusions

- **Unable to rule out any of our smoking guns**
- *Flooding*: marshes submerged during study, increasing trend
- *Salinity*: variability in porewater and riverine salinity; increasing trend
- *Suspended sediment*: low inputs from watershed, mainly from Bay
- *Nutrients*: Elevated

General Recommendations

- Restoration and adaptive management will need to consider trends and interactions among drivers
- Enhance sediment deposition on marsh spit surface, e.g. thin-layer disposal, to help spits maintain elevation vs sea level
- Protect spit edges from boat wakes
- Hydrologic engineering to reduce salinity intrusion
- Reduce nutrient loads

Fowl River Marsh Study

QUESTIONS, DISCUSSION AND FEEDBACK

Vegetation Characteristics of Spits

Spit 2.7:

- Average Herbaceous Cover: 54.1%
- Average Woody Cover: 2.8%
- Total Vegetative Cover: 56.9%
- **Total Number of Species: 26**

Sagittaria lancifolia Linnaeus —
BULLTONGUE ARROWHEAD —
10.2%

Magnolia virginiana Linnaeus var.
australis Sargent —SILVER BAY —
1.2%

Spit 2.4:

- Average Herbaceous Cover: 56.6%
- Average Woody Cover: 5.4%
- Total Vegetative Cover: 62.0%
- **Total Number of Species: 41**

Cladium jamaicense Crantz —
SAWGRASS — **30.1%**

Juncus roemerianus Scheele —BLACK
NEEDLERUSH — **6.1%**

Morella cerifera (Linnaeus) Small —
WAX MYRTLE — **1.8%**

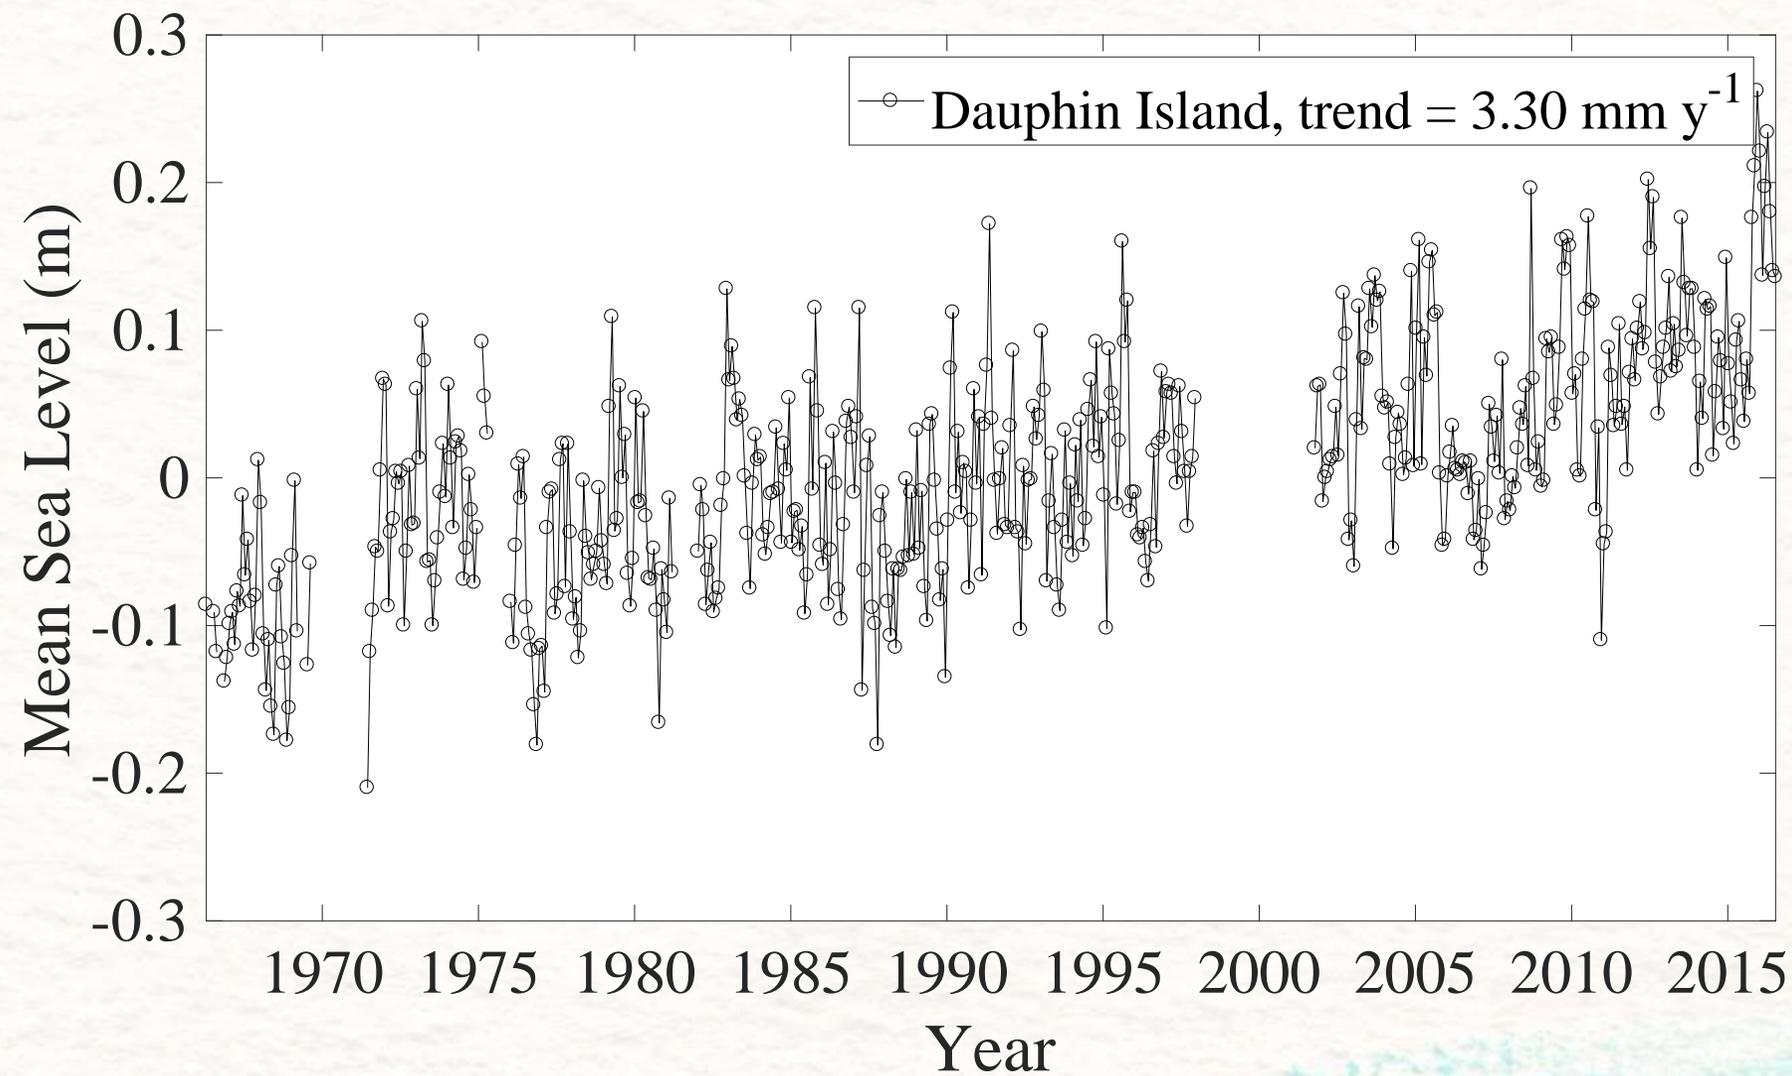

Spit 3.4:

- Average Herbaceous Cover: 33.9%
- Average Woody Cover: 0.0%
- Total Vegetative Cover: 33.9%
- **Total Number of Species: 13**

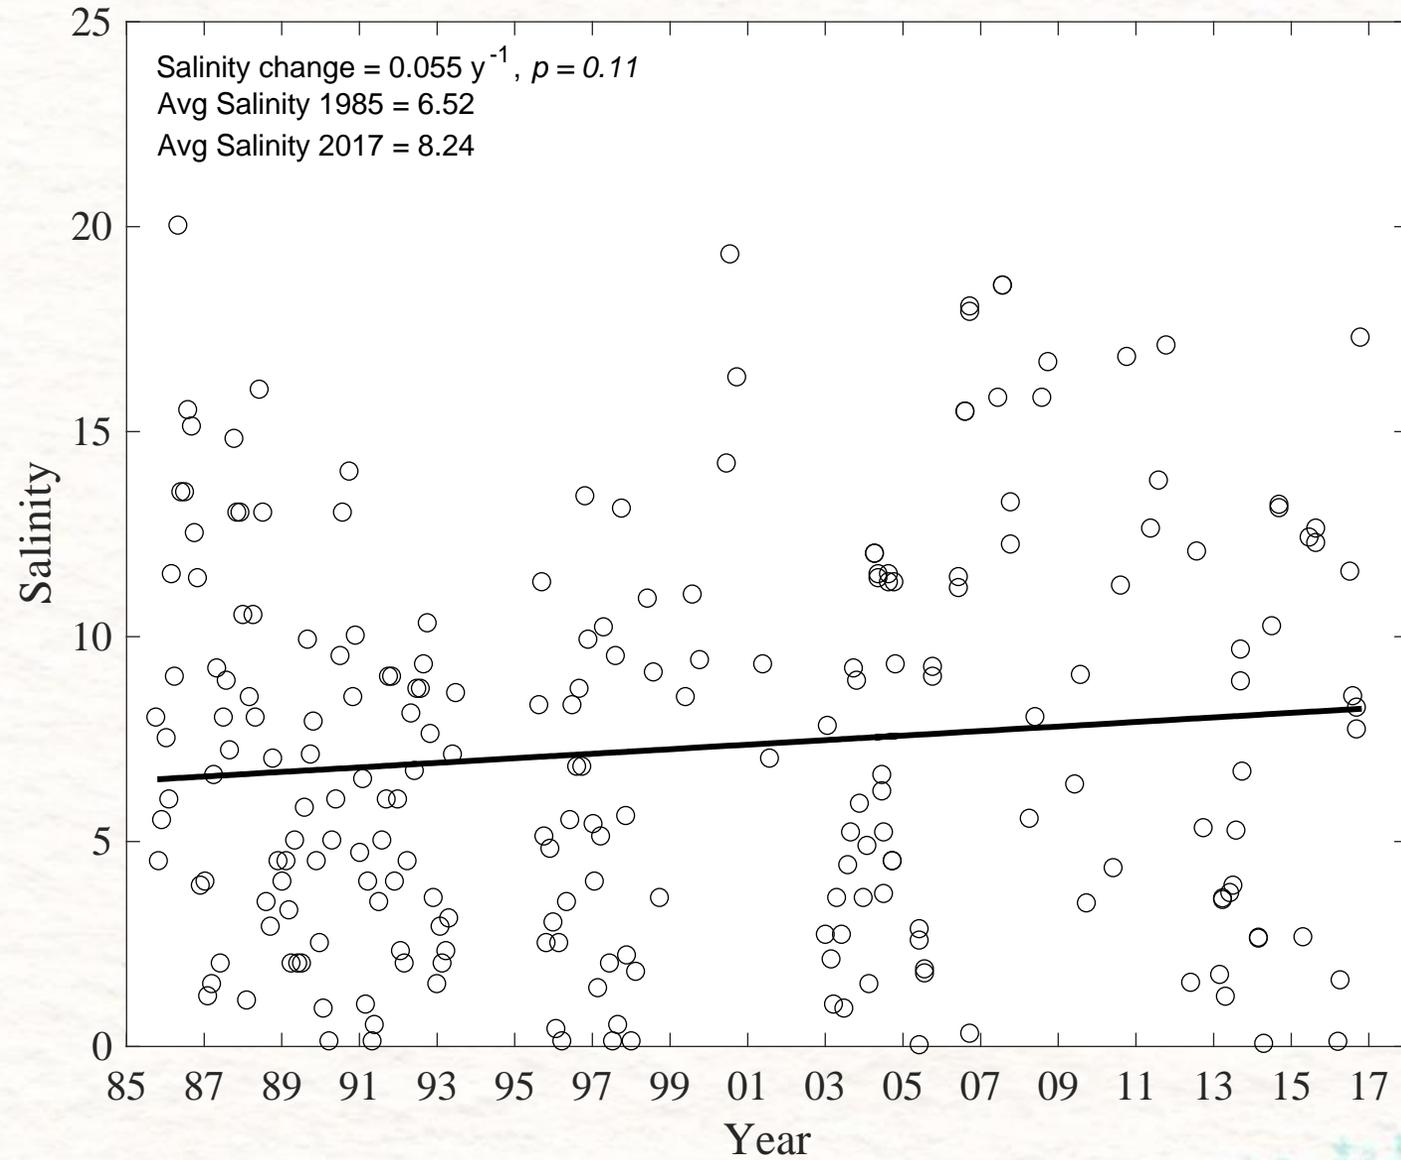

Juncus roemerianus Scheele —BLACK
NEEDLERUSH — **24.4%**

Sagittaria lancifolia Linnaeus —
BULLTONGUE ARROWHEAD —
4.4%

Trends

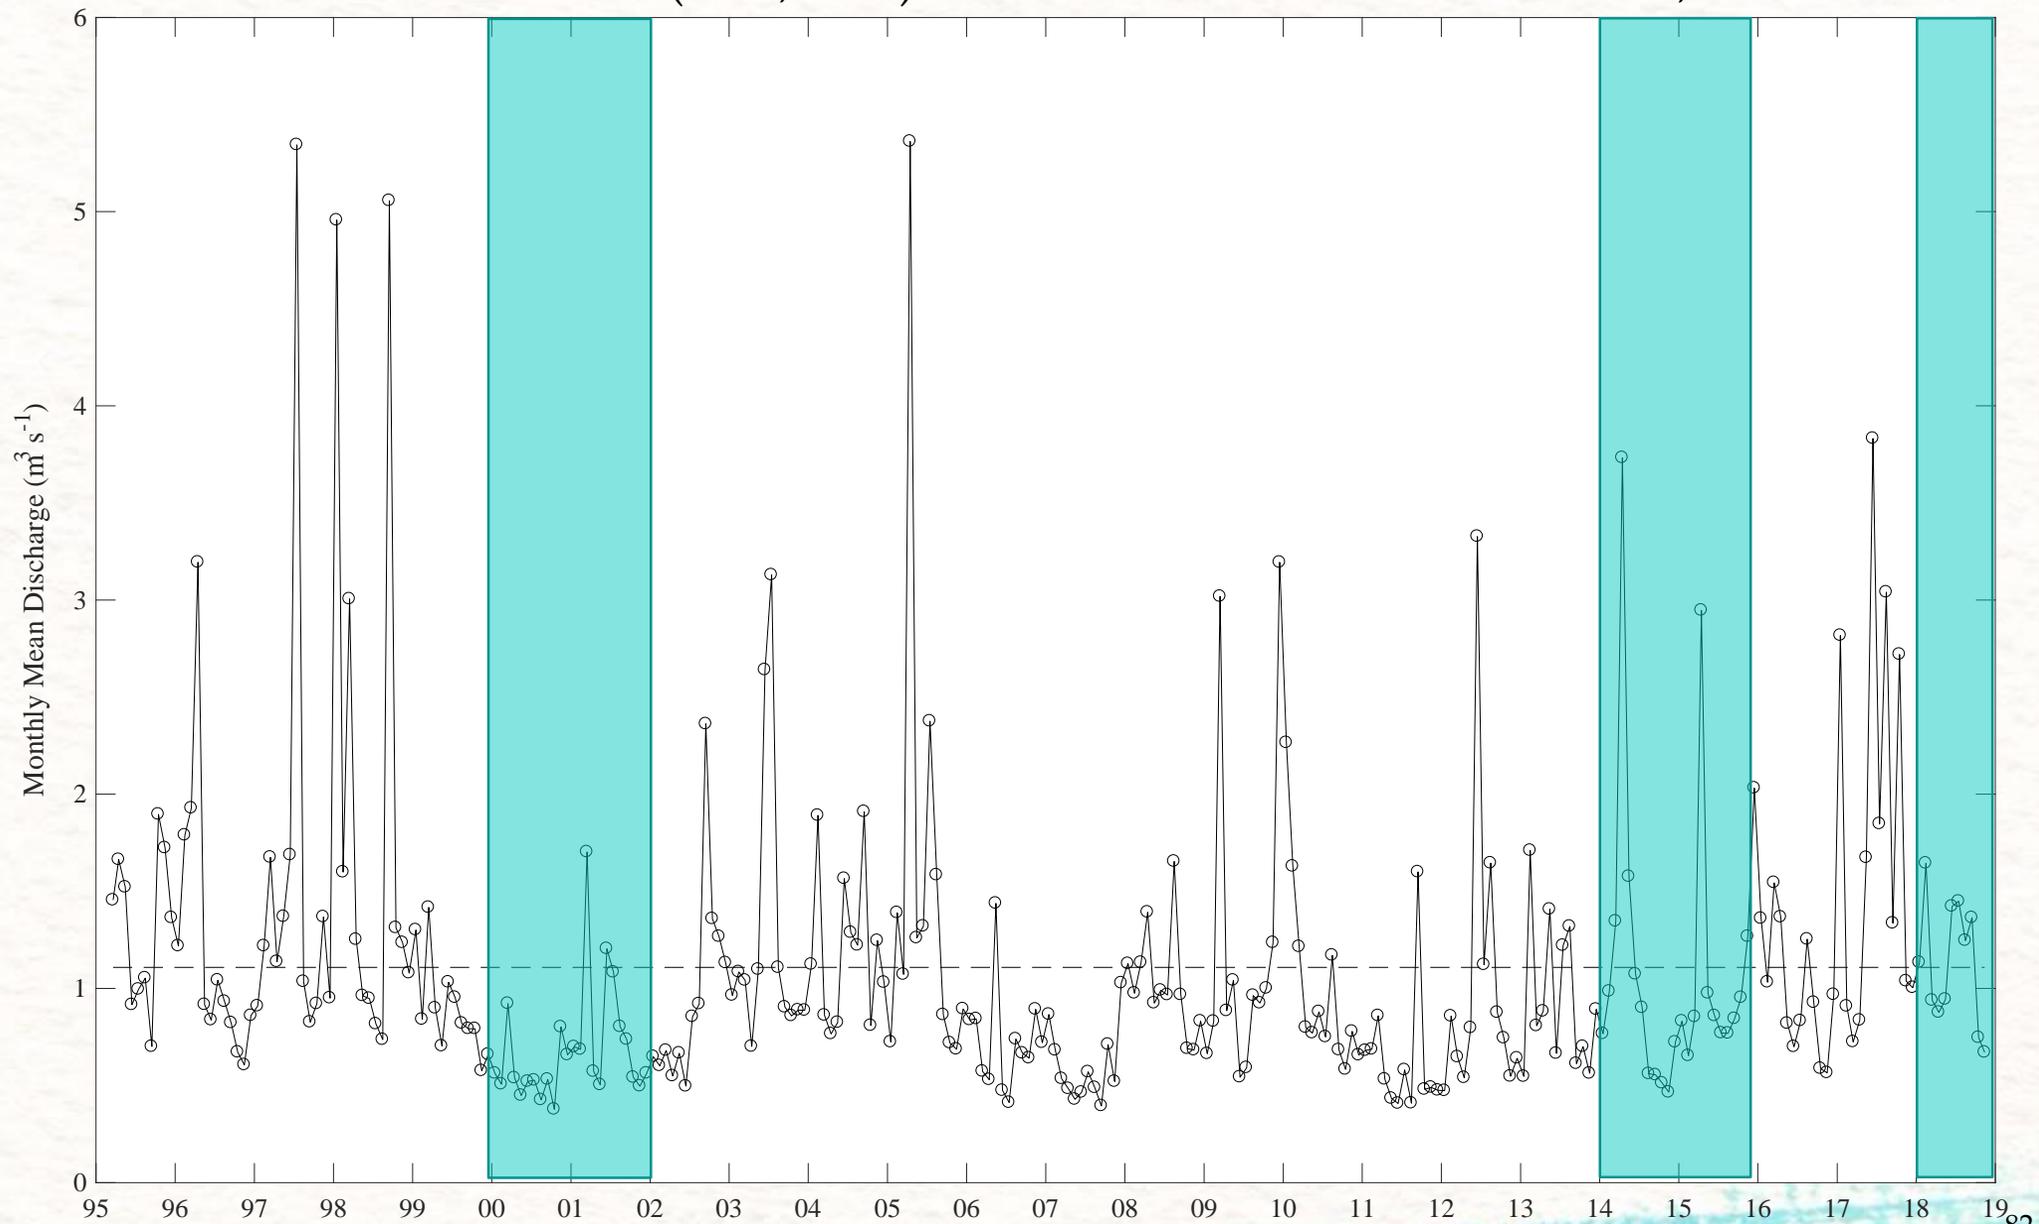

Trends

Lehrter (2005; 2008)

DISL, EPA

This Study

Conclusions

- **Unable to rule out any of our smoking guns**
 - *Flooding*: Marshes submerged during study, increasing sea level trend
 - *Salinity*: Porewater and riverine salinity; increasing trend
 - *Suspended sediment*: Low inputs from watershed, sediments mainly from Bay; accretion not keeping up with sea-level rise
 - *Boat wakes*: High frequency of boat wakes
 - *Nutrients/Eutrophication*: Highly eutrophic

General Management Options

- Restoration and adaptive management will need to consider trends and interactions among drivers
- Protect spit edges from boat wakes
- Avoid hardened shorelines that will increase erosion in adjacent areas, exacerbating land loss along the river
- Hydrologic engineering to reduce salinity intrusion
- Reduce nutrient loads
- Enhance sediment deposition on marsh spit surface, e.g. thin-layer disposal, to help spits maintain elevation vs sea level
- Purchase or dedication of land for conservation
